**trade-mark** (träd'märk), *n.* A distinguishing mark or device adopted by a manufacturer and impressed on his goods, labels, etc., to indicate the origin or manufacturer; in *law*, a particular mark or symbol which is used by a person for the purpose of denoting that the article to which or to packages of which it is affixed is sold or manufactured by him or by his authority, or used as a name or sign for his place of business to indicate that he carries on his business at that particular place, and which by priority of adoption and more or less exclusive use, or by government sanction and registration, is recognized and protectable as his property.

In Great Britain, the United States, and other countries the registration and protection of trade-marks are provided for by statute. The earliest trade-marks appear to have been those which were used in the manufacture of paper, and which are known as *water-marks*.

Of these the most ancient known appears on a document bearing the date 1351 — that is, shortly after the invention of the art of making paper from linen rags. The foundation of the protection afforded by the law to the owners of trade-marks is in the injustice done to one whose trade has acquired favor with the public if competitors are allowed, by colorable imitation of methods first adopted and continuously used by him for making his products recognizable, to induce intending purchasers to take their goods instead of his. The same kind of protection is therefore given, within just limits, to style and color of package and label as to specific symbols.

See *merchant*.

It is characterized by flowers in sessile or panicled fascicles within the base of complicate floral leaves, by anther-cells commonly on the margins of a broadish connective, and by a three-celled ovary with two ovules in each cell. There are about 32 species, all American, both northern and tropical. They are perennial herbs with simple or somewhat branched stems of much variety in leaf and habit. The fascicles of the inflorescence resemble compact umbels, but are centrifugal; they are either loosely or densely panicled, or, as in *T. virginica*, are reduced to a single fascicle. The species are known as *spiderwort* (which see); three or four occur within the United States, of which *T. virginica* is widely distributed and is often cultivated in gardens; two others are southern — *T. rosea* and *T. floridana*. Several species are cultivated under glass, as *T. discolor*, a white-flowered evergreen with leaves purple beneath, and *T. zebrina*, a trailing South American perennial. See *scandering-jew*.

Also *trades-unionism*.

Brit.*, XVIII, 30.

**trade-wind** (trad'wind), *n.* [*< trade<sup>1</sup>, 2, + wind<sup>2</sup>.* Cf. *to blow trade*, under *trade<sup>1</sup>*.] A wind that blows in a regular trade or course—that is, continually in the same direction. Trade-winds, or specifically the *trade-winds*, prevail over the oceans in the equatorial regions, from about 30° N. latitude to 30° S. latitude, blowing in each hemisphere toward the thermal equator, but being deflected into northeasterly and southeasterly winds respectively by the earth's rotation. Over the land the greater friction, irregular temperature-gradients, and local disturbances of all kinds combine to interrupt their uniformity. The trade-winds form a part of the general system of atmospheric circulation arising from the permanent difference in temperature between equatorial and polar regions. By the greater heating of the torrid zone the air is expanded, occasioning a diminished density of the surface-layer and an increase of pressure at high levels, which produce a tendency for the air to flow off toward the poles on either side. This overflow reduces the atmospheric pressure near the equator, and increases it in the higher latitudes to which the current flows. These conditions, therefore, give rise to two permanent currents in each hemisphere—a lower one, the *trade-wind*, blowing from near the tropics to the thermal equator, and an upper one, the *anti-trade*, flowing from the equator to about the thirtieth parallel of latitude, where it descends, producing there the calms of Cancer and Capricorn, and continues northward or southward, according to the hemisphere, as a surface-current with a component of motion to the eastward, arising from the earth's rotation. In the northern hemisphere these anti-trades are much interrupted by irregular temperature-gradients over the great continents and by cyclonic storms; but in the southern hemisphere, where these disturbances are less, the anti-trades attain such a force as to give the name of "the roaring forties" to the belt of latitude where they are chiefly felt. On their equatorial side the trade-winds die out in a belt of calms, which varies in breadth, in different seasons and different longitudes, from 150 to 600 miles. In March the center of the calm-belt is approximately at the equator, while in summer it rises in some longitudes to 8° or 9° N. latitude. The trade-wind zones in all oceans change their position with the season, moving to the northward from March to midsummer, and southward from September to March, the range of oscillation being from 200 to 600 miles. During the first nine months of the year the equatorial limit of the northeast trade in the Atlantic lies in a higher latitude near the west coast of Africa than it does further to the westward until the fortieth meridian is passed, where the limit again recedes from the equator. From October to December, however, the North Atlantic trade-wind extends to its lowest latitude on the African coast. On the eastern side of each ocean the polar limit of the trade-wind extends furthest from the equator, and blows most directly toward it: thus, on the coast of Portugal and on the coast of California, the trade-wind reaches far north of the tropics, the extension of it being often felt as far north as latitude 40°, and it is frequently felt as a north wind. Toward the western part of each ocean the trade-wind becomes more easterly, often prevailing due east for many days. The trade-wind attains its greatest strength in the South Indian ocean, which is called the "heart of the trades"; in the Pacific it does not blow with either the strength or the constancy that it has in the Atlantic; and in parts of the South Pacific it is frequently interrupted by westerly winds, which prevail through the summer, and sometimes through the greater part of the year. The region of high pressure at the tropics is in the form of great anticyclones extending in an east and west direction, and having shifting boundaries and variable gradients. As a consequence, the strength, and in some regions the direction, of the trades are subject to considerable variations. In general, the regions of the trade-winds have a scanty rainfall, for cyclones do not occur except in limited areas and at definite seasons; and convection-currents, although frequently covering the sky with a small detached cloud known as *trade cumulus*, are generally insufficient to produce rain.

Thus to the Eastern wealth through storms we go,  
But now, the Cape once doubled, fear no more;  
A constant *trade-wind* will securely blow,  
And gently lay us on the spicy shore.

**tradiometer** (trā-di-om'e-tēr), *n.* A species of dynamometer for determining the draft of vehicles, plows, mowing-machines, etc. In one form the draft is applied to a kind of spring scale interposed between the draft-animal or propelling machine

and the vehicle, plow, etc., the extension of the spring denoting the draft. Other more refined forms have been invented. One of these, by a tracing-point moved according to the pull, marks a curve on a disk, by which a variable draft is indicated.

**tradition** (trā-dish'on), *n.* [*< ME. tradicion, < OF. tradicion, F. tradition = Pr. tradicion = Sp. tradicion = Pg. tradição = It. tradizione, < L. traditio(n)-, a giving up, a surrender, delivery, tradition, < tradere, pp. traditus, deliver, < trans, over, + dare, give; see date<sup>1</sup>.* Cf. *trason*, a doublet of *tradition*.] 1. The act of handing over something in a formal legal manner; the act of delivering into the hands of another; delivery.

2. The handing down of opinions, doctrines, practices, rites, and customs from ancestors to posterity; the transmission of any opinion or practice from forefathers to descendants or from one generation to another, by oral communication, without written memorials.

It is not true that written history is a mere *tradition* of falsehoods, assumptions, and illogical deductions, of what the writers believed rather than of what they knew, and of what they wished to have believed rather than what was true. *Stubbs, Medieval and Modern Hist.*, p. 75.

3. A statement, opinion, or belief, or a body of statements or opinions or beliefs, that has been handed down from age to age by oral communication; knowledge or belief transmitted without the aid of written memorials.

*Maundrell, Aleppo to Jerusalem*, p. 50.

Nobody can make a *tradition*; it takes a century to make it. *Hawthorne, Septimius Felton*, p. 111.

4. (a) In *theol.*, that body of doctrine and discipline supposed to have been revealed or commanded by God, but not committed to writing, and therefore not incorporated in the Scriptures. According to the Pharisees, when Moses was on Mount Sinai two sets of laws were delivered to him by God, one of which was recorded, while the other was handed down from father to son, and miraculously kept uncorrupted to their day. These are the traditions referred to in Mat. xv. 2 and other parallel passages. Roman Catholic theologians maintain that much of Christ's oral teaching not committed to writing by the immediate disciples has been preserved in the church, and that this instruction, together with that subsequently afforded to the church by the direct teaching of the Holy Spirit—all of which is to be found in the writings of the fathers, the decrees of councils, and the decretals of the Popes—constitutes a body of tradition as truly divine, and therefore as truly authoritative, as the Scriptures themselves (*L. Abbott, Dict. Rel. Knowledge*). Anglican theologians, on the other hand, while acknowledging tradition recorded in ancient writers as of more or less authority in interpretation of Scripture and in questions of church polity and ceremonies, do not coordinate it with Scripture.

Why do thy disciples transgress the *tradition* of the elders? for they wash not their hands when they eat bread. *Mat. xv. 2.*

The authority for this endless, mechanical religionism was the commands or *traditions* of the Fathers, handed down from the days of the Great Synagogue, but ascribed with pious exaggeration to the Almighty, who, it was said, had delivered them orally to Moses on Mount Sinai.

*C. Geikie, Life of Christ*, II. 205.

By apostolical *traditions* are understood such points of Catholic belief and practice as, not committed to writing in the Holy Scriptures, have come down in an unbroken series of oral delivery, and varied testimony, from the apostolic ages.

*Faith of Catholics*, II. 387.

(b) In *Mohammedanism*, the words and deeds of Mohammed (and to some extent of his companions, not contained in the Koran, but handed down for a time orally, and then recorded. They are called *hadish*, 'sayings,' or oftener *sunna*, 'customs,' and they constitute a very large body, and have given rise to an immense literature. By their acceptance or non-acceptance of the traditions as authoritative, the Mohammedans are divided into *Sunnites* and *Shiites*. See *Sunna, Sunnite*.

5. A custom handed down from one age or generation to another and having acquired almost the force of law.

**tragedy** (traj'e-di), *n.*; pl. *tragedies* (-diz). [X ME. *tragedie*, *tragedye*, < OF. *tragedie*, F. *tragedie* = Sp. Pg. It. *tragedia*, < L. *tragedia*, ML. also *tragedia*, tragedy, a tragedy, lofty style, a great commotion or disturbance, < Gr. *τραγῳδία*, a tragedy (see def.), serious poetry, an exaggerated speech, a melancholy event, < *τραγῳδός* (> L. *tragædus*), a tragic actor or singer, lit. 'a goat-singer', < *τράγος*, a goat, he-goat (lit. 'nibbler', < *τρώγω*, *τρώγειν*, nibble), + *ὄδός*, contr. of *αὐδός*, a singer (cf. *ὄδῳ*, *ὠδὸς*, a song), < *αἰδέειν*, *αἰδῶν*, sing (see *ode*), and same termination appears in *comedy*. The orig. reason of the name *τραγῳδός*, 'goat-singer', is uncertain. (a) In one view, so called because a goat was the prize for the best performance. This would require *τραγῳδός* to mean 'singer for a goat,' and would make the name for a distinctive character or act depend on a subsequent fact, namely, the goat given at the end of the performance to only one of the performers. (b) In another view, so called because a goat was sacrificed at the singing of the song—a goat as the spoiler of vines, if not on other accounts, being a fitting sacrifice at the feasts of Bacchus. But this again makes the name depend on a subsequent act, or an act not immediately concerned with the 'goat-singer'—unless indeed the 'goat-singer' himself killed the goat. (c) It is much more probable that the *τραγῳδός* was lit. 'a goat-singer' in the most literal sense, a singer or actor dressed in a goatskin, to personate a satyr, hence later 'an actor in the satyric drama,' from which tragedy in the later sense was developed. Whatever the exact origin of the term, the ult. reference was no doubt to the satyrs, the companions of Bacchus, the clowns of the original drama. Cf. *τραγῳδός*, a comic actor, similarly named from his disguise, namely, from the leas with which his face was smeared (< *τρίξ* (*τρίξ*), leas, + *ὄδός*, singer).] 1. A dramatic poem or composition representing an important event or series of events in the life of some person or persons, in which the diction is grave and dignified, the movement impressive and stately, and the catastrophe unhappy; that form of the drama which represents a somber or a pathetic character involved in a situation of extremity or desperation by the force of an unhappy passion. Types of these characters are found in Shakspeare's Lady Macbeth and Ophelia, Rowe's Jane Shore, and Scott's Master of Ravenswood. Tragedy originated among the Greeks in the worship of the god Dionysus or Bacchus. A Greek tragedy consisted of two parts—the dialogue, which corresponded in its general features to the dramatic compositions of modern times; and the chorus, the tone of which was lyrical rather than dramatic, and which was meant to be sung, while the dialogue was to be recited.

*Tragedie* is for to seyn a certeyn storie . . . Of him that stood in greet prosperitee, And is fallen out of heigh degree Into miserie, and endeth woe-hedly. And they ben versified comounly Of six feet, which men clepe exametrown. In prose eek ben endytud many oon, And eek in metre, in many a sondry wyse. *Chaucer*, Prolog. to Monk's Tale, l. 85.

seines of similar form fastened together at their edges.  
The inner net is very loose and full, and of fine thread  
and small mesh. The two outer ones have a mesh from  
3 to 6 inches long, and of coarser thread. The fish pass  
readily through the outer seines and strike the inner net,  
which is thus pocketed through one of the large meshes,  
the fullness of the inner net  
readily permitting this pro-  
trusion. The fish are thus  
held in a kind of pocket.

2. In *scholastic philos.*, not included under one of the ten categories; higher than the categories.—3. In *Kantian philos.*, transcending experience; unrealizable in experience; not an object of possible experience.

For any question or theorem which might pass beyond possible experience Kant reserved the term *transcendent*.

Adamson, Fichte, p. 112.

4. Transcending the universe of matter; not essentially connected with the universe; not cosmic: as, a *transcendent* deity. **Transcendent judgment, univocation**, etc. See the nouns.—Syn. 1. Preeminent, surpassing, supereminent, unequalled, unparalleled, unrivaled, peerless.

II. n. 1. That which surpasses or excels; anything greatly superior or supereminent.

Jer. Taylor, Works (ed. 1835), II. 260.

2. In *metaph.*: (a) A reality above the categories or predicaments. The transcendents were said to be six: Ens, Res (thing), Aliquid (something), Unum (one), Verum (true), Bonum (good); or five, Ens being omitted. (b) That which is altogether beyond the bounds of human cognition and thought. Compare I., 3.—3. In *math.*, a transcendental expression or function.

N. Green, Cosmologia Sacra.

2. In *philos.*: (a) In Aristotelian philosophy, extending beyond the bounds of a single category. The doctrine implied is that every strictly univocal predicate is contained under one of the ten predicaments; but there are certain predicates, as *being* (ens), *one*, *true*, *good*, which are univocal in a modified but not very clearly defined sense, which extend over all the predicaments or categories. (b) In Cartesian philosophy, predicable both of body and of spirit. **Clauberg**. (c) Pertaining to the existence in experience of a priori elements; a priori. This is chiefly a Kantian term, but was also used by Dugald Stewart. See *Kantianism*, *category*, *a priori*.

*Transcendental* and *transcendent* do not mean the same thing. The principles of the pure understanding, which we explained before, are meant to be only of empirical, and not of *transcendental* application, that is, they cannot transcend the limits of experience. A principle, on the contrary, which removes those landmarks, nay, insists on our transcending them, is called *transcendent*.

Kant, Critique of Pure Reason (tr. by Müller), II. 256.

The belief which all men entertain of the existence of the material world (I mean their belief of its existence independently of that of perceptive beings), and their expectation of the continued uniformity of the laws of nature, belong to the same class of ultimate or elemental laws of thought with those which have been just mentioned. The truths which form their objects are of an order so radically different from what are commonly called truths, in the popular acceptance of that word, that it might perhaps be useful for logicians to distinguish them by some appropriate appellation, such, for example, as that of *metaphysical* or *transcendental* truths. They are not principles or data . . . from which any consequence can be deduced, but form a part of those original stamina of human reason, which are equally essential to all the pursuits of science, and to all the active concerns of life.

D. Stewart, Collected Works (ed. Hamilton), III. 44.

(d) In Schellingian philosophy, explaining matter and all that is objective as a product of subjective mind.—3. Abstrusely speculative; beyond the reach of ordinary, every-day, or common thought and experience; hence, vague; obscure; fantastic; extravagant.

The soul, as recognized in the philosophy of the lower races, may be defined as an ethereal surviving being, conceptions of which preceded and led up to the more *transcendental* theory of the immaterial and immortal soul, which forms part of the theology of the higher nations.

E. B. Tylor, Prim. Culture, II. 21.

4. Not capable of being produced by the algebraical operations of addition, multiplication, involution, and their inverse operations. The commonest transcendental functions are *e<sup>x</sup>*, *log x*, *sin x*, etc.—**Pure transcendental synthesis of reproduction**. See *reproduction*.—**Transcendental amphiboly**. See *amphiboly*.—**Transcendental analytic**, that part of transcendental logic which treats of

the elements of pure intellectual cognition and the principles without which generally no object can be thought; the decomposition of our collective cognition a priori into the elements of pure intellectual cognition.—**Transcendental anatomy**. See *anatomy*.—**Transcendental apperception**, the original invariable self-consciousness, in which every thought is brought to logical unity.

—**Transcendental cognition**. Same as *transcendental knowledge*.—**Transcendental critic**, the doctrine of the correctness of human cognition, showing how far it is to be trusted, and what elements are subjective, what objective.—**Transcendental curve**. See *curve*.—**Transcendental deduction**, the explanation of the way in which concepts a priori can refer to objects.—**Transcendental dialectic**, the destructive part of transcendental logic, showing how the speculative reason falls into fallacies, owing to the nature of the mind.—**Transcendental equation**. See *equation*.—**Transcendental esthetic**, the Kantian doctrine of the forms of pure sensibility, space, and time.—**Transcendental exposition**, the definition of a concept as a principle from which the possibility of other synthetical cognitions a priori can be understood.—**Transcendental function, geometry, idealism**. See the nouns.—**Transcendental ideality**, the mode of existence of space and time according to the Kantian theory—that they are real in the sense of truly belonging to real phenomenal objects, but unreal in so far as they are elements imported by the mind.—**Transcendental imagination**, the reproductive synthesis which takes place in all perception.—**Transcendental knowledge**. (a) As used by Kant, knowledge concerning a priori concepts of objects. (b) Knowledge a priori. **Sir W. Hamilton**.—**Transcendental locus**, a locus which in the ordinary system of coordinates is represented by a transcendental equation.—**Transcendental logic**, the critic of thought; the theory of the origin of our knowledge in those elements of conception which cannot be attributed to sense.—**Transcendental object**, the unknown real object, according to the Kantian theory. See *universal*.—**Transcendental paradoxism**. See *paradoxism*.—**Transcendental perfection**, that perfection which consists in the presence of all that is necessary to the essence of the thing to which it belongs.—**Transcendental philosophy**. See *philosophy*.

—**Transcendental place**, the fact that a concept belongs either to sensibility on the one hand, or to the pure understanding on the other; the determination of an object either to be a phenomenon or to be a thing in itself.

—**Transcendental quantity**. (a) The degree with which a quality is possessed.

There is also another quantity improperly so called, which consists not in the extension of parts, but in the perfection and virtue of every thing. Hence uses it to be called the quantity of perfection and quantity of virtue.

For the essential perfections of things and virtues are composed of divers degrees, as the quantity of a heap or mole of several parts. This, because diffused almost through all the categories, uses to be called a *transcendental quantity*.

Burgersdicius, tr. by a Gentleman (1697), I. v. 2.

(b) The value of a transcendental function.—**Transcendental reality**. Same as *absolute reality* (which see, under *absolute*).—**Transcendental reflection**, the faculty by which, according to Kant, we are immediately aware of the faculty which has furnished a concept, whether sense or understanding. In *ceram.*, a common method of decorating the surface of fine earthenware used for table-service, etc. An engraving is made upon a copperplate, and impressions of this on paper are applied to the ware. The process is of two kinds. (a) Press-printing is done upon the biscuit. The color which is applied to the copperplate is mixed with oil, and is kept hot during the process of mixing and application. When this has been printed upon paper, the latter is laid upon the ware, and is rubbed forcibly upon the back; it is then plunged into water, and the paper is washed off, while the color mixed with oil remains upon the biscuit. The oil is then entirely driven away by heat in the hardening-kiln. This is necessary, because the glaze would otherwise be rejected by the oily color. (b) Bat-printing is done upon the glaze, the engraved copperplate being oiled and then cleaned off, so that the oil remains in the engraved lines; this is transferred to a surface of glue, and from that to the already glazed pottery, upon which the design appears in pure oil, the color being afterward dusted upon it, and adhering to the oil until fired in the enamel-kiln.

2. [*cap.*] A festival observed in the Greek, the Roman Catholic, and the Anglican Churches on August 6th, in commemoration of Christ's transfiguration.—*Syn. 1.* See *transform*, *v. t.*

*Rom. xii. 2.*

These dispositions, that of late *transform* you

From what you rightly are. *Shak., Lear, i. 4. 242.*

4. In *math.*, to alter from one figure or expression to another differing in form but equal in quantity. See *transformation*, 4.—*Syn. 1-3.* *Transform*, *Transmute*, *Transfigure*, and *Metamorphose* agree in representing a thorough change, *transform* being the most general word. *Transform* is the only one that applies to change in merely external aspect, as by a change in garments, but it applies also to internal change, whether physical or spiritual: as, the caterpillar is *transformed* into the butterfly; the drunkard is *transformed* into a self-controlling man. *Transmute* is founded upon the idea of a rearrangement of material, but it really notes the highest degree or the most remarkable forms of change, a complete change of nature, amounting even to the miraculous or the impossible: as, to *transmute* iron into gold; the word is figurative when not applied to physical change. *Transfigure* is controlled in its signification by the use of the word in connection with the change in the appearance of Jesus Christ, as related in Mat. xvii., Mark ix., and Luke ix. It applies only to a change in aspect by which a spiritual uplifting seems to exalt and glorify the whole person, and especially the countenance. *Metamorphose* now seems figurative when not used with scientific exactness according to the definitions under *metamorphosis*.

II. *intrans.* To change in appearance or character; undergo transformation; be metamorphosed: as, some insects *transform* under ground; the pupa *transforms* into the imago.

Merlin that was with hem *transformed* in to the seinblance of a yonge knyght of xv yere age.

*Merlin (E. E. T. S.), iii. 607.*

His hair *transforms* to down.

*Addison, tr. of Ovid's Metamorph., ii.*

**transformable** (tranz-fôr'mă-bl), *a.* [*F. trans-*

*formabilis*, *L.*] Capable of being transformed.

*H. Spencer, Principles of Psychology*, p. 47.

**transformance** (tranz-fôr'măns), *n.* [*F. trans-*

*formance*, *L.*] A transformation; a semblance;

*transformance of a person as you may be sure will keep*

*you from being deceived.* *Chambers*, May-day, ii. 4.

**transformation** (tranz-fôr'mă'shôn), *n.* [*F. trans-*

*formation*, *L.*] *Sp. transformación, transform-*

*iento*, *Port. transformação*, *It. trasformazio-*

*ne*, *Fr. transformation*, *L.L. transformatio*, *n.*, a

change of shape, *L. transformator*, change the

shape of; see *transform*.] 1. The act or opera-

tion of transforming, or the state of being trans-

formed; a change in form, appearance, nature,

disposition, condition, or the like.

*Transformation of apostate man*

*From fool to wise, from earthly to divine.*

*Is work to him that needs him.*

*Chambers*, Task, v. 495.

The transformation of barren rock into life-supporting

soil takes countless ages.

*H. Spencer, Social Statics*, p. 378.

2. In *bot.*, metamorphosis, in any sense; espe-

cially, the metamorphosis of those organisms

which undergo obvious and great changes of

form, as that of insects in passing from the

larval to the imaginal state. *Metamorphosis* is the

most frequent technical term. By some zoologists *trans-*

*formation* is restricted to the series of changes which

FIGURE 10. (a) Larva, (b) pupa, (c) adult insect, showing transformation. (a) Larva, (b) pupa, (c) adult insect, showing transformation. (a) Larva, (b) pupa, (c) adult insect, showing transformation.

every germ undergoes in completing the embryonic condition, as those observed within the egg; while *metamorphosis*, according to the same authorities, designates the alterations which are undergone after exclusion from the egg, and which alter extensively the general form and mode of life of the individual. But this distinction of the synonymous words is seldom maintained. See *metamorphosis*, 2, 4, and compare *transformation*.

3. The change of one metal into another; transmutation of metals, according to the alchemists.

—4. In *math.*, a passage in the imagination

from one figure or expression to another differ-

ent in form but equal in quantity. Thus, the vol-

ume of an oblique prism is ascertained by a transforma-

tion of it into a right prism of equal volume. Especially

(a) The passage from one algebraical expression to an-

other in other terms. (b) The passage from one equation

to another expressive of the same relation, by substitut-

ing for the independent variables it involves their val-

ues in terms of another set of such variables equal in

number to the old ones. This is called a *transformation*

of the equation, but when this denotes a locus, and one

set of coordinates is substituted for another, it is inaccur-

ately but universally called a *transformation of the coor-*

*ordinates*. (c) A correspondence. If in the transformation

of coordinates the new coordinates are conceived to be

measured in a different space or locus in quo, a projection

or correspondence has taken place, and this, being still

called a *transformation*, gives rise to such phrases as *trans-*

*formation between two planes*. Thus, if in the equation of

a conic we substitute  $x = 1 + y, y = 1 + z$ , we effect a

transformation of the equation. This may be regarded as

signifying a mere transformation of coordinates; but if

$x, y, z$  are conceived to be coordinates of a correspond-

ing point in the same or another plane, and measured

similarly to  $x, y, z$ , we have a transformation between the

planes, which transforms the conic into a unicursal quartic.

The whole analytical theory being identical under the

two interpretations, the word *transformation* has been

unavoidably transferred from one application to the other.

5. In *pathol.*, a morbid change in a part, which

consists in the conversion of its texture into

one which is natural to some other part, as

when soft parts are converted into cartilage or

bone. Such transformation is generally a de-

generative or retrograde metamorphosis.—6.

In *physiol.*, the change which takes place in

the component parts of the blood during its

passage from the minute arteries through the

capillary system of vessels into the radicles of

87. The shape to which some person or thing has been transformed.

If it should come to the ear of the court how I have been transformed, and how my *transformation* has been washed and cudgelled, they would melt me out of my fat drop by drop. *Shak.*, *M. W. of W.*, iv. 5. 98.

**Arguesian transformation**, a transformation between two spaces where the relation between the two sets of point- or line-coordinates is defined by the equations  $x = ay + z, y = az + w$ . Every surface will thus be transformed into a surface having the edges of the tetrahedron of reference as nodal lines.—**Backlund's transformation**, a transformation between two pseudospherical surfaces having equal negative curvature.—**Bilinear transformation**, a transformation defined by a bilinear equation.—**Biquadratic transformation**, a transformation by substituting for one set of variables others that are biquadratic functions of them.—**Birational transformation**, a transformation where the variables of each of the two sets are rational functions of those of the other set. When the variables are homogeneous coordinates, and the transformation is not linear, there is a certain nodal locus whose correspondence is indeterminate.—**Caseous or cheesy transformation**. See *caseous*.—**Cremona transformation**, a birational transformation between two planes. Every curve in one plane is transformed into a curve of the same deficiency in the other plane, and there are certain nodal points through which all such curves pass, having certain lines as multiple tangents.—**Cubic transformation**, a transformation by substituting for one set of variables others that are cubic functions of them.—**Degree of a transformation**. See the quotation.

When the points of a space  $S$  have a (1, 1) correspondence with those of another space  $s$  in such a manner that the planes and the right lines of  $s$  correspond to surfaces  $F$  of  $m$ th order, and to curves  $C$  of the  $n$ th order in the former space  $S$ , I say that the transformation of  $s$  into  $S$  is of the  $m$ th degree, and that the inverse transformation is of the  $n$ th degree. *Cremona*.

**Determinant of a linear transformation**. See *determinant*. **Hessian transformation**, a transformation of a ternary quantic, obtained by substituting for the homogeneous variables the umbrae  $A_1, A_2, A_3$ , which are such that  $A_1 A_2, A_1 A_3, A_2 A_3$ , etc., are the minors of the Hessian of the quantic.—**Homographic transformation**. (a) A transformation between two planes or spaces such that the point-coordinates in one correspond to tangential coordinates in the other. (b) A transformation by means of a lineal equation connecting the old variable with the new one. Such a transformation is called *homographic* because it does not alter the value of an anharmonic ratio.—**Imaginary transformation**. See *imaginary*.—**Infinitesimal transformation**, a transformation in which the variables are increased by infinitesimal amounts. The infinitesimal transformation  $\xi, \eta$  is that which results from the substitution of  $x + \xi, y + \eta$  for  $x, y$ , where  $\xi$  is infinitesimal. If this substitution can be made in a differential equation by virtue of that equation, the equation is said to admit the infinitesimal transformation  $\xi, \eta$ .—**Landen's transformation** [named after its discoverer, the English mathematician John Landen (1719–1800)], a transformation of an elliptic integral of the first species by which its modulus is changed from  $k$  to the arithmetico-geometrical mean of  $k$  and unity.—**Lie's transformation**, a transformation in which to all the lines tangent to one surface at each point correspond all the spheres tangent to another surface at a corresponding point.—**Linear transformation**, a transformation by means of a system of equations giving the values of the old variables as linear functions of the new.—**Line-point transformation**, a transformation in which lines correspond to points.—**Modular transformation of an elliptic integral**. See *modular*.—**Modulus of a linear transformation**. See *modulus*.—**Order of a transformation**. Same as *degree of a transformation*.—**Orthogonal transformation**, a linear transformation in which the sum of the squares of the variables remains unchanged.—**Polar transformation**. (a) A transformation in which two variables  $r$  and  $\theta$  are replaced by two others  $\rho$  and  $\phi$ , by means of the equations  $\theta = m\phi, \log r = m \log \rho$ . The geometrical effect is that of passing from the stereographic to Lagrange's map-projection (which see, under *projection*). (b) A transformation by means of polar triangles in spherical trigonometry.—**Quadratic or quadric transformation**, a transformation in which each of the old variables is a quadratic function of the new ones; especially, a quadratic Cremona transformation where to a right line in either of two planes corresponds a conic in the other, with three nodal points.—**Rational transformation**. See *rational*.—**Reciprocal transformation**, a transformation by means of the equations  $x : y : z = x_1^{-1} : y_1^{-1} : z_1^{-1}$ .—**Transformation by symmetric functions**, a transformation of an equation by substituting for the variable a rational function of the roots by means of the properties of symmetric functions.—**Transformation of energy**. **transformation-scene** (tranz-fôr'mă'shôn-sen), *n.* *Theat.*, a scene which changes in sight of the audience; specifically, a gorgeous scene at the conclusion of the burlesque of a pantomime, in which the principal characters are supposed to be transformed into the chief actors in the immediately following harlequinade.

*transformator*, *< L. transformare*, transform: see

*transform*.] In *elect.*, same as *transformer*.

**transformer** (tranz-fôr'mér), *n.* One who or

that which transforms. The alternate-current trans-

former, which is the one most extensively used in elec-

tricity, is an apparatus similar to an induction-coil, con-

sisting of two coils of insulated wire wound on an iron

core for the purpose of furnishing, by means of a current

of small quantity and high potential in one circuit, a cur-

rent of large quantity and low potential in another cir-

cuit. One of the coils, called the primary, of comparative-

ly high resistance and large number of turns, is included

in the high-potential circuit, while the other is included

in the low-potential circuit. The mechanical transformer

consists of a motor driven by a high-potential current,

combined with a dynamo driven by this motor, and fur-

nishing a current of potential and quantity adapted to the

circumstances where it is to be used. This form is appli-

able to direct as well as to alternating currents.

**transformism** (tranz-fôr'mizm), *n.* [*< trans-*

*form* + *-ism*.] In *biol.*, the fact or the doc-

trine of such modification of specific charac-

ters in any organism as suffices to change one

species into a different species, whether im-

mediately or in the course of time; transmuta-

tion of species (see *transmutation*, 1 (c)). The

term has nothing to do with the transformation or meta-

morphosis which any organism may undergo in the course

of its individual life-cycle. It has attached to some ex-

treme views of the natural possibilities of transmutation,

as of a plant into an animal, a horsehair into a hairworm,

and the like—nothing of this sort being known as a fact

in nature. But in the scientific conception of the term,

*transformism*, like *transmutation* in its biological sense,

is simply the doctrine of descent with modification on ac-

cepted principles of evolution, and, so understood, com-

mands the assent of nearly all biologists. See *Darwinism*,

*evolution*, 2 (a), selection, 3, species, 5, transmutation, 1 (c),

and transpeciation.

On the other hand, we may suppose that crayfishes have

resulted from the modification of some other form of liv-

ing matter; and this is what, to borrow a useful word

from the French language, is known as *transformism*.

The act of transfusing, or of pouring, as a liquid, out of one vessel into another; hence, in general, transmission; transference.

2. In *med.*, the transmission of blood from one living animal to another, or from a human being or one of the lower animals into a human being, with the view of restoring the vigor of exhausted subjects or of replacing the blood lost by hemorrhage; also, the intravenous injection of other liquids, such as milk or saline solutions, in order to restore the circulating fluid to its normal volume, as after severe hemorrhage. This operation is of old date, but seems to have ended generally in failure until about 1824, the chief cause of failure probably being the want of due precautions to exclude the air during the process.

Mem. that at the Epiphany, 1649, when I was at his house, he then told me his notion of curing diseases, &c., by *transfusion* of blood out of one man into another, and that the hint came into his head reflecting on Ovid's story of Medea and Jason. *Aubrey*, Lives (Francis Potter).

runs against you, or throws water in your face.

**2.** Effected by, or existing as the result of, trans-  
ference or extension of signification; deriva-

Although by far the greater part of the transitive or de-

countable caprices of the feelings or the fancy, there are  
certain cases in which they open a very interesting field  
of philosophical speculation. *D. Stewart*.

**3.** In *gram.*, taking a direct object; followed  
by a substantive in an accusative relation:  
said of a verb, or of the action expressed by a  
verb. Transitive is opposed to *intransitive*; but the dis-  
tinction, though practically valuable, is only of minor im-  
portance, since no transitive verb is in English incapable  
of intransitive use, and also many intransitives can be used  
transitively, and verbs that are transitive in one language  
are the opposite in another, and so on. Abbreviated *t.* and  
*trans.*

**4.** Serving as a medium or means of transition.  
[Rare.]

An image that is understood to be an image can never  
be made an idol; or, if it can, it must be by having the  
worship of God passed through it to God; it must be by  
being the analogical, the improper, the transitive, the rela-  
tive (or what shall I call it) object of Divine worship.

**translatableness** (trâns-lä'ta-bl-nes), *n.* The  
character of being translatable. *Athenæum*,

move from one place to another; transfer; spec-  
ifically, in *mech.*, to impart to (a particle or  
body) a motion in which all its parts move in  
the same direction.

or beside one's self.

**5†.** To cause to remove from one part of the  
body to another: as, to *translate* a disease.—

**7.** To render into another language; express  
the sense of (something expressed in the words  
of one language) in the words of another lan-  
guage; interpret.

And gee schulle undirstonde, that I have put this boke  
out of Latyn into Frensch, and *translated* it agen out  
of Frensch into Englyssche, that every man of my nacioun  
may undirstonde it. *Mandeville, Travels*, p. xi.

Neither of the rivals [Pope and Tickell] can be said to  
have *translated* the "Iliad," unless, indeed, the word *trans-*  
lation be used in the sense which it bears in the "Mid-  
summer Night's Dream." *Macaulay, Addison*.

**8.** To explain by using other words; express in  
other terms; hence, figuratively, to present in  
another form.

*Translating* into his own clear, pure, and flowing lan-  
guage what he found in books well known to the world,  
but too bulky or too dry for boys and girls.

*Mayhew, London Labour and London Poor*, II. 110.

**11.** In *teleg.*, to retransmit (a message). See  
*translation*, 7. = *Syn. 7* and *8. Render, Interpret, Trans-*  
*late, Construe. Render* is the most general in its mean-  
ing, but is usually followed by *into*: as, to *render* Gray's

"Elegy" into Latin verse; to *render* a learned discourse  
into vernacular. *Interpret*, like *render*, does not neces-  
sarily mean to change to another language, but it does  
mean, as *render* need not, to change to intelligible form,  
generally by following the text closely: as, to *interpret*  
an inscription; to *interpret* an address by a foreigner.  
*Translate* is literally to turn from one language to an-  
other, which is presumably one's own, unless another is  
mentioned, but the word has figuratively, the meaning  
of *interpret*. To *construe* is to *translate* or to *interpret*,  
generally by following along word by word or clause by  
clause; hence the word is very often used of the work of  
a beginner: as, the painful *construing* of a sentence of  
Cæsar's "Commentaries." In its figurative use it retains  
much of this meaning: as, I cannot *construe* his language  
in any other way. See *explain*.

**II. intrans.** 1. To be engaged in translating,  
or practise translation.

All these my modest merit bade *translate*,  
And own'd that nine such poets made a Tate.

of the same line.

machine or for purposes of adjustment; specifi-  
cally, in breech-loading ordnance, a screw for  
moving in or out the wedge in the fermeture.

*translatio* (-n-), transference, transplanting,  
version, transferring, translation, *< translatus*,

*late*, *transfer*.] **1.** The act of translating. (a) The  
removing or conveying of a thing from one place to an-  
other; transportation; removal.

Made and done was the *translation* [to Paris] . . .  
Off hed and of the glorious body [of St. Louis].

don to Canterbury is taken especial notice of in the Saxon  
Chronicle under the year 1023.

*Rock, Church of our Fathers*, III. i. 352, note.

(b) The removal of a person from one office to another, or  
from one sphere of duty to another; specifically, the re-  
moval of a bishop from one see to another; in Scotland,  
the removal of a clergyman from one pastoral charge to  
another.

Does it follow that a law for keeping judges independ-  
ent of the crown by preventing their *translation* is ab-  
solutely superfluous? *Brougham*.

We can quite understand . . . Richard I. meditating  
the *translation* of the Archbishop of Monreale to Canter-  
bury. *Stubbs, Medieval and Modern Hist.*, p. 134.

(c) The removal of a person to heaven without death.

Time, experience, self-reflections, and God's mercies  
make in some well-tempered minds a kind of *translation*  
before death. *Sir T. Browne, Christ. Mor.*, ii. 6.

(d) The act of turning into another language; interpre-  
tation.

The chiefest of his [King Athelstan's] Works for the Ser-  
vice of God and Good of his Subjects was the *Translation*  
of the Bible into the Saxon Tongue.

*Baker, Chronicles*, p. 10.

At best, the *translation* of poetry is but an imitation of  
natural flowers in cambric or wax.

other language; a version; the reproduction  
of a literary composition in a language foreign

*lation* in the World. *Selden, Table-Talk*, p. 20.

metastasis.

*translation* of humours from his joints to his lungs.

*Harvey*.

**5.** The process of manufacturing from old ma-  
terial. [Slang.]

*Translation*, as I understand it (said my informant), is  
this—to take a worn old pair of shoes or boots, and by  
repairing them make them appear as if left off with hard-  
ly any wear, as if they were only soiled.

*Mayhew, London Labour and London Poor*, II. 40.

**6.** In *mech.*, motion in which there is no rota-  
tion; rotation round an infinitely distant axis.

A change of place in which there is no rotation is called  
a *translation*. In a rotation the different parts of the body  
are moving in different ways, but in a *translation* all parts  
move in the same way. *W. K. Clifford, Lectures*, II. 12.

**7.** In *teleg.*, the automatic retransmission of a  
message received on one line over another, or  
over a continuation of the same line. This is used  
on long lines to increase speed of working, and also at re-  
ceiving-stations, and the translation is made from the line-  
circuit to a local circuit containing a local battery and the

of the white blood-corpuscles from the capillaries into the surrounding tissues in commencing inflammation. (b) The supposed passing of the soul into another body after death; metempsychosis, reincarnation.

In life's next scene if transmigration be,  
some bear or lion is reserved for thee.  
Dryden, Aurengzebe, iii. 1.

The theory of the *Transmigration of Souls*, which has indeed risen from its lower stages to establish itself among the huge religious communities of Asia, great in history, enormous even in present mass, yet arrested and as it seems henceforth unprogressive in development; but the more highly educated world has rejected the ancient belief, and it now only survives in Europe in dwindling remnants.

The act of transmitting, or the state of being transmitted; transmittal; transference.

Landor, *Imag. Conv.*, Alfieri and Metastasio.

2. In *biol.*, specifically, same as *heredity*.

Specifically—(a) In *telegr.*, the sending or despatching instrument, especially that under the automatic system, in which a paper strip with perforations representing the Morse or a similar alphabet is passed rapidly through an instrument called an *automatic transmitter*, in which contacts are made by metallic points wherever a perforation occurs, and are prevented where the paper is unperforated. *E. H. Knight*. (b) In *telephony*, the microphonic or other apparatus, together with the funnel for receiving the voice and converging the waves of sound upon the thin iron diaphragm. See *telephone*.

(c) In *biol.*, the change of one species into another by any means; transpeciation; transformism. The history of the idea or of the fact runs parallel with that of *transformism*, from an early crude or vulgar notion akin to that involved in the alchemy of metals (see above) to the modern scientific conception of *transmutation* as an evolutionary process, or the gradual modification of one species into another by descent with modification through many generations.

The *transmutation* of plants one into another is "inter magna natura": for the *transmutation* of species is, in the vulgar philosophy, pronounced impossible; . . . but seeing there appear some manifest instances of it, the opinion of impossibility is to be rejected.

Bacon, *Nat. Hist.*, § 525.

2. In *bot.*, the exhalation of watery vapor from the surface of the leaves of plants. A great part of the water which serves as the vehicle of the nutritious substances contained in the sap is disposed of by transpiration. When thus given out it sometimes appears in the form of extremely small drops at the tip of the leaf, and especially at the extremities of the nerves.—**Pulmonary transpiration**, the exhalation of watery vapor from the blood circulating through the lungs. It may be made evident by breathing on a cold reflecting surface.—**Transpiration of gases**, the motion of gases through a capillary tube under pressure. The rate of motion varies with the composition of the gas, but bears a constant relation not coinciding with density, diffusion, or any other known property. The velocity depends not simply on the friction of the gas against the surface of the tube, but much more on the friction of the gas-particles against each other, and the transfer of momentum which thus results. A comparison of the velocity of transpiration with that of effusion has led to important conclusions in regard to molecular magnitudes.—**Transpiration of liquids**, the motion of liquids through minute orifices or capillary tubes under pressure. The rates of such motions are greatly increased by heat.

**transpiratory** (trân-spîr'a-tô-ri), *a.* [*< transpire + -at-ory.*] Of or pertaining to transpiration; transpiring; exhaling.

The act of transposing; a putting of each of two things in the place before occupied by the other; less frequently, a change in the order of more than two things; also, the state of being transposed, or reciprocally changed in place. — 2. In *alg.*, the bringing over of any term or terms of an equation from one side to the other side. This is done by changing the sign of every term so transposed, the operation being in effect the adding of the term with its sign reversed to both sides of the equation. If  $a + x = b + c$ , then by transposition we get  $x = b + c - a$ , or  $x = b + c - a$ , or  $x = b + c - a$ , etc. 3. In *rhet.* and *gram.*, a change of the usual order of words in a sentence; words changed from their ordinary arrangement for the sake of effect.

We have deprived ourselves of that liberty of *transposition* in the arrangement of words which the ancient languages enjoyed. H. Blair, *Rhetoric*, viii.

4. In *music*, the act, process, or result of altering the tonality of a piece or passage from a given tonality, either in performance or in transcription. Transposition in itself involves only a change of key-note and a uniform shift of pitch upward or downward; but such a change may also involve more or less serious collateral changes. In purely vocal music slight transpositions are practically immaterial, and considerable ones are only noticeable because they change the ease or the method in which given tones are produced. Transposition in instrumental music, however, usually involves somewhat radical changes in the mechanism of performance, as in fingering, stopping, etc.; and these changes often involve also extensive changes in the ordinary staff notation. Musically such mechanical or graphic changes are merely nominal and fictitious, though they often appear to have considerable importance.

5. In *med.*, same as *metathesis*. 2. — **Transposition of the viscera**, a condition in which the organs within the abdomen and thorax are situated on the side opposite to that which they normally occupy, the liver being on the left side, the spleen on the right, etc.

**transpositional** (trâns-pô-zish'ôn-ál), *a.* [*< transposition + -al.*] Of or pertaining to transposition; also, of the nature of transposition; transpositive.

The most striking and most offensive error in pronunciation among the Londoners, I confess, lies in the *transpositional* use of the letters *v* and *u*, ever to be heard when there is any possibility of inverting them. Thus they always say "weal" for "veal," "vicked" for "wicked."

Pegge, *Anecdotes of the Eng. Lang.*

**transpositive** (trâns-poz'î-tiv), *a.* [= F. *transpositif*; as *transpose + -it-ive*.] Of the nature of transposition; made by transposing; consisting in transposition.

The French language is . . . the most determinate in the order of its words. . . . The Italian retains the most of the ancient *transpositive* character. H. Blair, *Rhetoric*, vii.

**transprose** (trâns-prôz'), *v.* [*< trans + prose.*] To change from verse into prose. The Buckingham quotation (of date 1671) follows and arises out of that given under *transverse*, *v. t.*, 2; and Marvell's title is evidently a fanciful adaptation of the passage in "The Rehearsal." The Dryden quotation is an allusion to Elkanah Settle's giving to his poem upon Dryden's "Absalom and Achitophel" (part i.) the title of "Achtophel Transposed." The uses of the word are humorous throughout; and, indeed, Marvell's work is prose named from prose, while Settle's is verse named from verse.

Johns. Methinks, Mr. Bayes, that putting Verse into Prose should be call'd *Transprosing*.

Bayes. By my troth, a very good Notion, and hereafter it shall be so. Buckingham, *The Rehearsal*, i. 1.

There can be little doubt that Queen Elizabeth was a believer in a real, but not in a *transubstantiated* presence. Ellis's *Letters*, p. 269, note.

**transubstantiation** (trân-sub-stan'shi-â'shon), *n.* [*< F. transubstantiation = Sp. transustanciacion, trasustanciacion = Pg. transubstanciación = It. transustanziazione, < ML. transubstantiatio(n-), transubstantiatio(n-)* (used for the first time by Peter Damian, d. 1072; according to Trench, by Hildebert, d. about 1134), < *transubstantiare, transubstantiare*, change into another substance: see *transubstantiate*.] A change of one substance into another; specifically, in *theol.*, the conversion, in the consecration of the elements of the eucharist, of the whole substance of the bread into the body, and of the whole substance of the wine into the blood, of Christ, only the appearances of the bread and wine remaining. This is the doctrine of the Roman Catholic Church. The Greek Church calls the change *μετουσίωσις* ("transubstantiation" or "transcensation"); but it is a disputed question whether it holds the same doctrine. Transubstantiation is one of several forms in which the doctrine of the real presence is held. See *doctrine of the real presence* (under *presence*), and *consubstantiation*.

These words, "This is my body," . . . must needs be plain, single, and pure, without . . . any subtle *transubstantiation*.

*substantiation* the sacrament itself be first possessed with Christ, or no? Hooker, *Eccles. Polity*, v. 67.

The change of the whole substance of the bread into the body, of the whole substance of the wine into the blood [of Christ], only the appearances of bread and wine remaining; which change the Catholic Church most fitly calls *transubstantiation*.

to form a water-seal to prevent the passage of air or gases through a pipe with which it is connected. Traps are made in a great variety of shapes, the aim being in all to cause a portion of liquid to lodge in a depression and form a seal. The most common forms are without valves. Air-pipes used in connection with traps (see the figures) not only conduct away foul gases, but prevent any regurgitation of gas through the water or siphoning out of the water-seal resulting from changes of pressure in the soil-pipe, such as sometimes occurs in unventilated traps, undue pressure in which causes the gas to pass the water-seal, while a very slight fall below atmospheric pressure causes the water to siphon over into the soil-pipe and thus destroy the seal. Various special forms are called *gas-traps*, *grease-traps*, etc. Also called *trapping*.

Each section or single length of a trawl is a skate. In England a single trawl is usually forty fathoms in length, with twenty-six hooks attached by snoods. As many of these lines are united as it is thought expedient to join, and are shot across the tide as the vessel sails along, so that the snoods may hang clear. There are usually anchors near the ends at intervals of forty fathoms, to keep the line in position, as well as buoys to float it. The trawl used in America consists of a long line from forty fathoms to several miles in length, which is anchored at each end to the bottom, the position of the ends being shown by buoys; lines about 2 to 6 feet long, with a hook at the end, are attached at intervals of about 3½ to 15 feet. In some cases the hooks

on a single line number as many as five thousand; on the coasts of Maine and Massachusetts the usual number is from four hundred to three thousand. Bait of the proper kind is placed upon the hooks, and the lines are allowed to remain down through a part of a tide. If set at half-tide, they are sometimes overhauled at intervals of half an hour or an hour. When taking them up for examination, the fisherman, beginning at one end close to the buoy, lifts the main line to the surface and carries it along over one side of the boat, which is hauled along under the line toward the other end. The fish found upon the hooks are dropped into the boat by the man who pulls up the line, while a companion, as the line passes over the boat, puts new bait, if necessary, upon the hooks and drops them again into the water. The principal fish taken in this way on the United States coast are the cod, hake, haddock, and skate. It is also called *trot-line*, and in Great Britain is known as *long-line, spillan, spillar, spiller, spilliard*, or *buttow*; the last is also the Canadian name.

2. A large bag-net, with a wide mouth held open by a frame or other contrivance, and often having net wings on each side of the mouth, designed to be dragged along the bottom by a boat. A beam about 14 feet long, made of stout iron gas-pipe, has fitted to it a net about 40 feet deep, fine toward the end and provided with numerous pockets, for the capture of bottom-fishes, as well as crabs, lobsters, etc. It cannot be used where the bottom is rocky or rough. In Great Britain the trawl-net is a large triangular purse-shaped net, usually about 70 feet long, about 40 feet broad at the mouth, diminishing to 4 or 5 at the cod, which forms the extremity furthest from the boat, and is about 10 feet long, and of nearly uniform breadth. The mouth is kept extended by a wooden beam. The net is furnished with two interior pockets, one on each side, for securing the fish turning back from the cod. Trawl-nets in various forms are also used for submarine exploration in deep water.

It is very desirable that the name *trawl* should be restricted to this net [flattened bag-net, often 100 feet long]. *Encyc. Brit.*, IX. 246.

**Beam-trawl**, a large net bag with a long beam across its open mouth, which is kept about 2 or 3 feet from the bottom by an iron framework at each end of the beam. As it is dragged along by the fishing-boat the fish pass into the net, and are caught in the pockets at the sides.

**Runner of a trawl**, that part of a trawl which stretches along the bottom, and to which the shorter lines with the hooks are attached.—To *set a trawl*, to put a trawl in working order.—To *strip a trawl*, to remove the hooks from the runner.—To *throw the trawl*, to set a trawl.

**trawl-anchor** (trâl'ang'kôr), *n.* A small anchor used on trawl-lines.

**trawl-beam** (trâl'bém), *n.* The beam by means of which the mouth of a trawl-net is held open, usually about 40 or 50 feet long. See *trawl*, 2.

**trawler** (trâl'ler), *n.* [ < *trawl* + *-er*.] 1. One who trawls, or fishes with a trawl-line or trawl-net.—2. A vessel engaged in trawling. Trawlers for cod average about seventy tons burden.

**trawl-head** (trâl'hed), *n.* One of two upright iron frames at the ends of a trawl-beam. [Eng.]

**trawling** (trâl'ing), *n.* [Verbal *n.* of *trawl*, *v.*] A mode of fishing. (a) Same as *trolling*: as, *trawling* for bluefish with a spoon trailed after a sailing-boat. (b) In the United States and Canada, the use of the trawl or trawl-line in fishing; the act of fishing with such a trawl. (c) In Great Britain, the use of the trawl or trawl-net; the act or occupation of fishing with such a trawl. It is the mode chiefly adopted in deep-sea fishing, and by it most of the fish for the London market are taken, with the exception of herring and mackerel. Cod, whiting, and other white fish are taken by it in large numbers, and some kinds of flatfish, as soles, can scarcely be taken in any other way. Trawling can be practised only on a smooth bottom, as a rough bottom would destroy the net. The term is often incorrectly applied in Scotland to a mode of catching herrings by fishing with the seine. Also called *trailing*.

"Beam-trawling" . . . consists in towing, trailing, or trawling a flattened bag-net, often 100 feet long, over the bottom in such a manner as to catch those fish especially which naturally keep close to or upon the ground. *Encyc. Brit.*, IX. 246.

**trawl-keg** (trâl'keg), *n.* A keg used to buoy a trawl-line, or to mark its position, as by means of a flag.

A trough, open box, or similar vessel used for different domestic and industrial purposes. Specifically—2. A flat shallow vessel or utensil with slightly raised edges, employed for holding bread, dishes, glassware, silver, cards, etc., and for other household uses. Trays are made in many shapes of wood, metal, papier-mâché, etc., and have various names according to their use, as *tea-tray*, *bread-tray*, *silver-tray*, etc. Thin trays of veneers are also used to pack butter, lard, and light materials for transport in small quantities. The tray differs from the salver only in size. Trays are used also in mining, as a washing-tray, a picking-tray.

Various priestly servants, all without shoes, came in, one of them bearing a richly embossed silver *tray*, on which were disposed small spoons filled with a preserve of lemon-peel. *R. Curzon, Monast. in the Levant*, p. 288.

3. A wide shallow coverless box of wood or cardboard, used in museums for packing and displaying specimens of natural history. Trays for small mammals, birds, etc., are usually from 1 to 3 feet long, half as wide, and from 1 to 3 inches deep; they are set in tiers, often in drawers of cabinets, or form such drawers. Trays for eggs are usually of light cardboard, from 1 by 2 to 4 by 8 inches wide and very shallow, fitted in a single layer in larger wooden trays or cabinet-drawers. The drawers or frames for holding eggs in an incubator are usually called trays. These are generally skeleton frames of wood, with bottoms of wire netting, and transverse wooden cleats fixed at intervals corresponding to the diameter of an egg, to prevent the eggs from rolling off.

4. A shallow and usually rectangular dish or pan of crockery ware, gutta-percha, papier-mâché, metal, or other material, used in museums for holding wet (alcoholic) specimens when these are overhauled for study, etc. Similar trays are used for ova in fish-culture, for many chemical operations, in photography, etc.—5. **treadle** (tréd'l), *n.* [*Also tredle; < ME. tredyl, < AS. tredel, a step, < tredan, tread: see tread.*] 1. A lever designed to be moved by the foot to impart motion to a machine, as a lathe, sewing-machine, or bicycle. It consists usually of a form of lever connected by a rod with a crank; but other forms employ straps or cords for transmitting the power. In the bicycle the treadle is practically the crank itself. In the organ, particularly the pipe-organ, and many machines, the drop-press, etc., where the treadle does not impart a rotary motion, but only starts, stops, or otherwise controls the machine or instrument, it is more properly a *pedal*, but in the reed-organ the foot-levers by which the feeders are operated are called either *treadles* or *pedals*. See cuts under *pepper, potter, reed-organ, ripple, sewing-machine, and spring-hammer*.

2. The tough ropy or stringy part of the white of an egg; the chalaza: so called because formerly supposed to be the male sperm. Compare *tread*, 4.

An appliance for producing rotary motion by the weight of a man or men, or of an animal, as a horse, stepping on movable steps connected with a revolving cylinder or wheel. The name is now rarely given to industrial appliances of this nature, but chiefly to those used as means of punishment in some prisons. Compare *horse-power*, 3, and see cut in next column. Hence—2. Figuratively, a monotonous and wearisome round, as of occupation or exertion: as, the *treadmill* of business.

**treadwheel** (tréd'hwēl), *n.* A contrivance for utilizing the weight of men or animals to produce rotary motion, which can then be applied to various mechanical purposes. It is of two principal forms: (*a*) A hollow cylinder set with the axis horizontal. An animal, as a dog, walks on the inner surface of the cylinder, to which battens are secured as a foothold, and thus revolves it. (*b*) A large flat disk of wood or other material set at an angle of about twenty degrees with the horizon. The animal which moves it stands on the disk at one side of the axis or pivot; its weight causes the disk to turn, and it is thus compelled to continue walking in order to keep its footing.

**treague** (trég), *n.* [*< It. tregua = Sp. tregua = Pg. tregoa = Pr. trega, tregua, treva, trev = OF. treve, trive, F. trêve, < ML. treuga (also, after OF., treva), a truce, < Goth. trigga = OHG. triwa = OS. trewa = AS. tréow, truth, truce: see true, truce.*] A truce.

Britton . . . more clearly states the idea of "betrayal" as distinct from that of "lese-majesty," and includes in *treason* any mischief done to one to whom the doer represents himself as a friend. *Stubbs, Const. Hist.*, § 463.

Specifically—2. Violation by a subject of his allegiance to his sovereign or liege lord, or to the chief authority of the state. In old English law it was (*a*) against the king or supreme power of the state, and more specifically called *high treason*, or (*b*) against any other superior, as a master, etc., and called *petty treason*. Various offenses falling far short of what is now deemed *treason*, such as counterfeiting money, were so considered. By modern law in England *treason*, more specifically called *high treason*, includes such offenses as imagining the king's (or queen's) death (that is, proposing to kill, maim, or restrain him), or levying war against him, adhering to his enemies, killing his wife or eldest son or heir, violating his wife or daughter or heir's wife, or killing the chancellor, treasurer, or a justice in office. *Treason* against the United States consists only in levying war against them, or in adhering to their enemies, or in giving their enemies aid and comfort; *treason* against a State is generally defined as consisting in hostility to a State only. The former punishment for *treason* in England was that the condemned should be drawn on a hurdle to the place of execution, and there be hanged and disemboweled alive, and then beheaded and quartered; and a conviction was followed by forfeiture of land and goods, and attainer of blood; but the penalty is now hanging.

For if it prosper, none dare call it *treason*.

*Sir John Harrington, Of Treason*.

*Treason* is a breach of allegiance, and can be committed by him only who owes allegiance, either perpetual or temporary.

*Marshall*.

**Constructive treason**, anything which, though lacking treasonable intent, is declared by law to be *treason* and punishable as such. Numerous acts suggestive of disaffection were formerly punished as *constructive treason* upon the pretext that they were in law equivalent to actual *treason*. Hence the provision of the Constitution of the United States (Art. III. § 3), according to which "*Trea-*

son against the United States shall consist only in levying War against them, or in adhering to their Enemies, giving them Aid and Comfort. No Person shall be convicted of *Treason* unless on the testimony of two Witnesses to the same overt Act, or on Confession in open Court. The Congress shall have power to declare the Punishment of *Treason*, but no Attainder of *Treason* shall work Corruption of Blood, or Forfeiture except during the Life of the Person attained."

Lord George Gordon was thrown into the Tower, and was tried before Lord Mansfield on the charge of high treason for levying war upon the Crown. The charge was what is termed by lawyers *constructive treason*. It rested upon the assertion that the agitation which he had created and led was the originating cause of the outrages that had taken place.

III., c. 2) declaring, for the first time, what offenses should be adjudged *treason*.—**Treason Felony Act**. See *felony*.—*Syn. See perdition*.

3. An agreement; a compact; specifically, a  
league or contract between two or more nations  
or sovereigns, in modern usage formally signed  
by commissioners properly authorized, and  
solemnly ratified by the several sovereigns or  
the supreme power of each state. The term *treaty*  
includes all the various transactions into which states  
enter between themselves, such as treaties of peace or of  
alliance, truces, and conventions. Treaties may be for  
political or for commercial purposes, in which latter form  
they are usually temporary. In most monarchies the power  
of making and ratifying treaties is vested in the sover-  
eign; in the United States of America it is vested in the  
President, by and with the consent of the Senate. Treaties  
may be concluded and signed by diplomatic agents, but  
these, of course, must be furnished with full powers by  
the sovereign authority of their respective states.

*Treaties*, allowed under the law of nations, are uncon-  
strained acts of independent powers, placing them under  
an obligation to do something which is not wrong.

*Woolsey, Intro. to Inter. Law*, § 93.

In the language of modern diplomacy the term *treaty*  
is restricted to the more important international agree-  
ments, especially to those which are the work of a con-  
gress, while agreements dealing with subordinate ques-  
tions are described by the more general term "conven-  
tion."

treaty**. See the qualifying words. — *Treaties of guaranty*.  
See *guaranty*. — *Treaty-making power*, that power of sovereignty which is exercised in the mak-  
ing of treaties with foreign nations. Although it extends  
to all classes of treaties, including commercial treaties, a  
treaty made by virtue of it does not have the effect to over-  
ride the revenue laws of the country when in conflict with  
them; nor does a treaty itself operate as equivalent to an  
act of the legislature in a case where the act of the legis-  
lature would be otherwise essential. In such case the  
treaty is regarded as a stipulation for legislative action,  
which must be had before the courts can enforce the treaty  
provision; for, except so far as the treaty is exterritorial,  
it does not dispense with the necessity of legislation to  
carry its stipulations into effect. — *Treaty of Adriano-  
ple*, a treaty between Russia and Turkey in 1829, favor-  
able to the former. — *Treaty of Aix-la-Chapelle*. (a) A

stones and other missiles into beleaguered towns and castles. It consisted of a beam called the *verge*, turning on a horizontal axis supported upon uprights. At one end of the verge was fixed a heavy weight, and at the other a sort of sling to contain the projectile—a device which greatly increased its force. To discharge the engine, the loaded end of the verge was drawn back by means of a windlass, and suddenly let go. It was possible to attain with the trebuchet great accuracy of fire. Prince Louis Napoleon, afterward Napoleon III., caused to be constructed in 1850 a model trebuchet which gave remarkable results.

By some explained as orig. 'a piece of wood peeled' or stripped of the bark; but the connection with Gr. *δέρω*, skin, flay (= E. *tear*), is phonetically impossible and notionally improbable, as the sense 'tree' is equally early in the records, and must have been earlier in fact; a standing tree would hardly derive its name from a name first given to a tree cut down and cut to pieces. Hence ult. *trā*<sup>1</sup> and prob. *trough*<sup>1</sup>.] 1. A perennial plant which grows from the ground with a single permanent woody self-supporting trunk or stem, ordinarily to a height of at least 25 or 30 feet. The line which divides trees from shrubs is largely arbitrary, and dependent upon habit rather than size, the tree having a single trunk usually unbranched for some distance above the ground, while a shrub has usually several stems from the same root and each without a proper trunk. (See *shrub*<sup>1</sup>.) Certain trees are anomalous or ambiguous in various respects. One is the giant cactus, with its columnar woody stem (see *saguaro*); another is the tree-fern. Some vines are of such dimensions as to form climbing trees—as, for example, species of *Metrosideros* in New Zealand, which at length destroy the supporting tree and stand in its place. The banana and plantain, though transient and somewhat herbaceous, are called trees from their size. In a special use a low plant (as a rose) trained into tree-form is called a tree. A large trained vine is also sometimes so called. In general, trees are either *endogenous* or *exogenous*, by far the greater number both of individuals and of species belonging to the latter class. Those of which the whole foliage falls off periodically, leaving them bare in winter, are called *deciduous*; those of which the foliage falls only partially, a fresh crop of leaves being always supplied before the mature leaves are exhausted, are called *evergreen*. Trees are also distinguished as *nuciferous*, or nut-bearing; *bacciferous*, or berry-bearing; *coniferous*, or cone-bearing, etc. Some are forest-trees, and useful for timber or fuel; others are fruit-trees, and cultivated in gardens and orchards; others serve chiefly for shade and ornament.

tresouriet, tresouryt, *n.* Middle English forms of *tresurer*.

trespacet, *v. t.* An old spelling of *trespass*.

trespass (trĕs'pas), *v. t.* [*ME. trespassen*, *trespacen*, < *OF. trespasser*, pass over, depart, die, *F. trespasser*, die, = *Pr. trespassar*, *trespassar*, *trespassar* = *Sp. trespassar* = *Pg. trespassar*, *trespassar* = *It. trapassare*, < *ML. transpassare*, pass over, trespass, < *L. trans*, over, + *passare*, pass; see *trans* and *pass*, *v.*, and cf. *transpass*.] 1. To pass beyond a limit or boundary; hence, to depart from life; die.

2. To make entry or passage without right or permission; go unlawfully or unwarrantably; encroach by bodily presence: with *on* or *upon*: as, to *trespass upon* another's land or premises.

3. To make an improper inroad upon a person's presence or rights; intrude aggressively or offensively in relation to something: with *on* or *upon*.

4. To commit an aggressive offense; transgress in some active manner; offend; sin: with *against*: as, to *trespass against* the laws of God and man. See *trespass*, *n.*

5†. To give offense: with *to*.

= Syn. 2 and 3. *Trespass upon*, *Encroach upon*, *Intrude upon*, *Trench upon*, *Infringe upon*, *Intrude upon*, *Transgress*. *Trespass upon*, though figurative, expresses generally the idea common to these words, that of unauthorized, improper, or undesirable coming upon ground not one's own. The order is essentially that of strength, and there is a corresponding increase in the presumption that the offense is committed knowingly. To *trespass upon* another's rights is literally to step or pass across the line of demarcation between his rights and ours. To *encroach upon* anything is to creep upon it to some extent, and often implies moving by stealth or by imperceptible degrees and occupying or keeping what one thus takes: the ocean may thus be said to *encroach upon* the land by wearing it away. To *intrude upon*, or latterly more often *trench upon*, is to cut into as a trench is lengthened or widened; it does not especially suggest, as does *encroach upon*, either slowness or stealth.

*Infringe* or *infringe upon* means a breaking into; hence it is a much stronger word than those that precede it. *Transgress* is stronger and plainer still, meaning to walk across the boundary, as of another's rights. *Intrude upon* suggests especially that one is unwelcome, and goes where regard for others' rights, as of privacy, or the sense of shame, should forbid him to press in.

trespass (trĕs'pas), *n.* [*ME. trespass*, < *OF. trespass*, departure, *F. trépas*, decease, = *Pr. trépas*, *trépas* = *Sp. trépas* = *Pg. trépasso*, *trépasso* = *It. trapasso*, departure, decease, digression, trespass; from the verb.] 1. Unlawful or forbidden entrance or passage; offensive intrusion of bodily presence. See 3 (b).

"There is neither knight or squire," said the pinder, . . . "Dare make a *trespass* to the town of Wakefield."

Jolly Pinder of Wakefield (Child's Ballads, V. 205).

2. An aggressive or active offense against law or morality; the commission of any wrongful or improper act; an offense; a sin: as, a *trespass* against propriety.

You hath he quickened, who were dead in *trespasses* and sins. *1 Ph.* ii. 1.

3. In *law*, in a general sense, any transgression not amounting to felony or misprision of felony. Specifically—(a) An injury to the person, property, or rights of another, with force, either actual or implied; technically called *trespass vi et armis*. In this sense it includes wrongs immediately injurious even when the force is only constructive, as in the enticing away of a servant. (b) A wrongful entry upon land of another: specifically called *trespass to real property*. Setting foot on another's land without right or license is technically considered a forcible trespass. Casting things upon it, suffering one's cattle to go upon it, or otherwise interfering with its possession is equally so.

Every unwarrantable entry on another's soil the law entitles a *trespass* by breaking his close. . . . For every man's land is, in the eye of the law, enclosed and set apart from his neighbour's. *Blackstone*, *Com.*, III. xii.

(c) An injury to property by one who has no right whatever to its possession or use: technically called *trespass to property*. In this sense it equally implies force, but relates to property only, and contradistinguishes the wrong from a conversion or embezzlement by a bailee or other person having already a rightful possession.—**Action of trespass**, an action to recover damages for trespass.—**Forcible trespass**, in *criminal law*, the offense of committing trespass to personal property with such display of force as to terrify or overawe. The similar offense respecting real property is called *forcible entry*.—**Trespass for mesne profits**. See *action of mesne profits*, under *profit*.—**Trespass on the case**, an action for a wrong which is not technically a trespass, because the injury is not in the strictest sense the direct result of the act, but where the transgressive character of the transaction appears from the circumstances of the case, as in the case of libel, malicious prosecution, and the like.

In the 16th century a special form of *trespass on the case* became, under the name of *assumpsit*, the common and normal method of enforcing contracts not made by deed, and remained so till the middle of the present century. *Encyc. Brit.*, XXIII. 454.

A single trestle is often used by mechanics to rest work against; two or more trestles serve as a support for a board or other object laid upon them horizontally for some temporary purpose. Early household tables commonly consisted of boards laid upon movable trestles, the board in this case being the table proper; and *trestle*, in the singular, is sometimes used for the whole support of a table when the parts are joined into a framework.

Keuper (see those words) are well-marked features of the geology. In the Alps, especially toward the eastern end of the range, the Triassic is developed to very great thickness and in great complexity of subgroups, each characterized by its own peculiar assemblage of fossils. This complexity is especially characteristic of the upper portion of the series. In England the line separating the Triassic from the Permian is much less distinctly marked than it is on the Continent. What was formerly called the "New Red Sandstone" is now divided, in accordance with paleontological and not lithological characters, into Permian and Triassic. In the United States the Triassic plays an important part, but varies greatly in character in different parts of the country. The sandstones of the Connecticut river valley and the continuation of the same formation to the south, through Pennsylvania and Virginia into North Carolina, constitute a very marked feature of the geology of the Atlantic belt of States, containing various fossil plants resembling those found in Europe on the same horizon, and especially characterized by tracks of vertebrates, while remains of their bony skeletons are extremely rare. The Triassic of the Rocky Mountain region is also an important formation (see *Red beds*, under *red*); and that of the western region of the Great Basin, of the Sierra Nevada, and of the ranges further north near the coast is also extremely interesting, resembling very closely in the character of its fossils the Triassic of the eastern Alps. The most striking feature of the flora of the Triassic is the predominance of the cycads, hence the period of deposition of this division of the series has sometimes been called the "age of cycads." The earliest remains of mammalian life are found in the Triassic, in the form of small marsupials. In the Alpine Triassic, both in the Alps and on the western coast of North America, there is a most remarkable commingling of Paleozoic and Mesozoic types of cephalopods.

**tribalism** (tri-bal-izm), *n.* [*Gr. τριβή* (*tri-*), three, + *-ism*.] The state of existing in separate tribes; *tribal* relation or feeling.

**tribe** (trib), *n.* [*Gr. τριβή* (*tri-*), three, + *-bē*.] 1. [*Gr. τριβή* (*tri-*), three, + *-bē*.] A division of the people, a tribe, in general the common people, the populace; traditionally explained as orig. a 'third part' of the people (one of the three divisions into which the Roman people were divided), and referred to *tres* (*tri-*), three (cf. dat. pl. *tribus*; *Gr. dial. τριπλῆς* for *τρίτης*, a third part). Cf. *W. tres*, village; *E. thorp*, a village.] 1. In *Rom. hist.*, one of the three patrician orders, or original political divisions of the people of ancient Rome, the Ramnes, Titites, and Luceres, representing respectively, according to tradition, the separate Latin, Sabine, and Etruscan settlements, having at their union equal representation in the senate, and retaining their distinctive names for several centuries. Hence—2. Any one of the similar divisions of a race or nation common in antiquity, whether of natural or of political origin: as, the *tribes* (*φύλῃ*) of Athens. Ethnical tribes among the ancients regarded themselves as enlarged families, and generally bore the name of some real or supposed common progenitor. Such were the twelve tribes of the Israelites, the tribes of the Dorians and other Greek races, etc. The thirty (and afterward more) tribes into which the plebeians in and around Rome were divided, after the formation of the patrician tribes, were based on locality; and tribes nearly corresponding to castes have in some instances been determined by occupation.

Have you collected them by *tribes*?

*Shak.*, Cor., iii. 3. 11.

3. Specifically, a division of a barbarous race of people, usually distinguishable in some way from their congeners, united into a community under a recognized head or chief, ruling either independently or subordinately. In general the tribe, as it still exists among the American Indians and many African and Asiatic races, is the earliest form of political organization, nations being ultimately constituted by their gradual amalgamation and loss of identity in the progress of civilization.

The characteristic of all these races [Uralian], when in the tribal state, is that the *tribes* themselves, and all subdivisions of them, are conceived by the men who compose them as descended from a single male ancestor. . . . In some cases the *Tribe* can hardly be otherwise described than as the group of men subject to some one chieftain. *Maine*, Early Hist. of Institutions, pp. 65, 69.

4. Any class or body of persons taken collectively; any aggregate of individuals of a kind, either as a united body or as distinguished by some common characteristic or occupation. [Chiefly colloq.]

And then there flutter'd in,

Half-bold, half-frightened, with dilated eyes,

A tribe of women, dress'd in hues.

*Tennyson*, Geraint.

5. A family of cattle having a common female ancestor. Tribes of cattle are particular strains, taking their names usually from some particular cow appearing in the pedigrees, as the Princess or Duchess tribes of shorthorns. 6. In *zool.* and *bot.*, a classificatory group of uncertain taxonomic rank, above a genus, and usually below an order; loosely, any group or series of animals: as, the furry, feathery, or funny *tribes*; the cat *tribe*. Linnaeus distributed the vegetable kingdom into three *tribes*, namely monocotyledonous, dicotyledonous, and acotyledonous plants, and these he subdivided into gentes or nations. By other naturalists *tribe* has been used for a division of animals or plants intermediate between order and genus. In botany this is the current and a very common use, the tribe standing below the suborder where that division is present. Cuvier divided his orders into families, and his families into tribes, including under the latter one or more genera. = *Syn.* 1-3. *Race*, *Clan*, etc. See *people*.

The name *trochee* or *chorée* (*trocheus*, *choreus*) was given by some ancient authorities to the tribrach. Also *tribrachys*.

*II. n.* A Roman Catholic: a name implying that the present system of Roman Catholic doctrine and practice dates from the Council of Trent (1545). The creeds of the Roman Catholic Church are four in number—the Apostles', the Nicene, the Athanasian, and the Creed of Pope Pius IV. The last named is also called the *Profession of the Tridentine Faith*. It was formulated in 1564, and includes the Nicene Creed, a summary of the doctrines defined by the Council of Trent, a recognition of the Roman Church as mother and teacher of all churches, and an oath of obedience to the Pope as successor of St. Peter and vicar of Christ. With the addition of the doctrines of the immaculate conception (promulgated in 1854) and the papal infallibility (defined in 1870), this creed is that which must be accepted by converts to the Roman Church, except those from the Greek Church (for whom special forms are provided), and is incumbent on all Roman Catholic priests and teachers.

Also called *trigeminal*, upon other considerations. The term *trifacial* is contrasted with *facial*, applied to the seventh cranial nerve, the main motor nerve of the muscles of the face. See *facial*. 2. *Of or pertaining to the trifacial nerve.*—**Trifacial neuralgia**, neuralgia of some portion of the face in the distribution of the trifacial nerve.

**II. n.** The trigeminal nerve. In man this is the largest cranial nerve, and resembles a spinal nerve in some respects, arising by two roots, a small anterior simple motor root and a large posterior ganglionated sensory root. The superficial or apparent origin from the brain is from the side of the pons Varolii, where the two roots come off together. It passes to a depression upon the end of the petrous bone, where the sensory fibers form the large semilunar ganglion known as the *Gasserian*; the motor fibers accompany but do not enter into the formation of this ganglion. Beyond the ganglion the nerve immediately divides into three main branches, the ophthalmic, supramaxillary, and inframaxillary, which leave the cranial cavity separately, respectively for the foramen lacerum anterius, foramen rotundum, and foramen ovale of the sphenoid bone. The motor fibers supply the muscles of mastication. The character of the nerve varies much in the vertebrate series. See cuts under *brain*, *Cyclodus*, *Esox*, and *Petromyzontidae*.

The typical Greek triglyph is a mas-

sive block incised with two entire vertical grooves cut to a right angle, called *glyphs*, framed between three fillets, and with a semi-groove at each side. The block is grooved on both sides to receive the adjoining metopes, which are thin slabs slid into their places from above. The triglyphs represent the ends of the ceiling-beams of the primitive wooden construction. In Greek use the exterior triglyphs of a range are always slightly displaced, so as to occupy the angles of the frieze instead of coming, like the others, over the centers of the columns; in Roman and affiliated architectures this refinement does not occur; and in Roman and even some of the later Greek examples the triglyphs are merely carved in relief in the face of the frieze-blocks, instead of being, as properly, independent blocks. See also cuts under *entablature* and *monotriglyph*.

All round between the *triglyphs* in the frieze there are most exquisite alt-reliefs of combats with centaurs, lions, and many on horses.

*Trilobita*: so called from the three lobes or main divisions of the body—cephalic, thoracic, and abdominal. See *Trilobita*. Trilobites are of much popular as well as scientific interest; some of them occur in profusion in Paleozoic formations, and trilobites as a group are among the longest and most widely known of fossils, not yet entirely divested of a problematical character. In the Linnean system all of the few forms then known were considered one species, named *Entomolitus paradoxus*, and a sort of likeness to chitons caused Latreille to range these organisms near those mollusks. Trilobites are the most characteristic fossils of their class throughout the Paleozoic rocks. More than 500 species have been described, and upward of 70 genera have been named and referred to several higher groups. Upward of 300 species, of about 50 genera, mostly of the Cambrian and Silurian, are described as British; 350 species, of 42 genera, are recorded from the lower Paleozoic rocks of Bohemia; the Devonian forms are comparatively few; and the series closes with some small Carboniferous species, mostly of two genera. The oldest genus is named *Agnostus*. Some of the trilobites are of comparatively gigantic size, as species of *Parabolobites*, 2 feet long. An ordinary trilobite, a species of *Dalmanites*, is named above. The body of a trilobite is generally of a flattened oval figure, whose upper side presents, besides the obvious transverse division into three parts, a median longitudinal elevation from one end to the other. The head, composed of several coalesced segments, and presenting certain sutures, constitutes a cephalic shield rounded in front, with an axial raised section, the glabella, on each side of which are large compound eyes (not unlike those of the horseshoe-crab), and whose lateral limbs or borders are prolonged backward to a varying distance on each side of the thorax (in some cases produced beyond all the rest of the body). The second division of the body consists of a varying number (up to twenty-six) of separate thoracic segments, which were more or less freely movable upon one another, so that some trilobites could roll themselves up in a ball, like a sowbug (asopod) of the present day. The raised axis of the thoracic division is the tergum and parts on each side of it are the pleura. The third division of the body is the abdomen or pygidium, of a variable number (up to twenty-eight) of segments, in general re-

*2.* One who does not openly incline to either side in a contest between parties; hence, one who tries to curry favor with both or with all parties; a time-server. The name was originally given, in English politics, to a party which followed the Marquis of Halifax, during the period from about 1680 to 1690, in trimming between the Whigs and the Tories.

The innocent word *trimmer* signifies no more than this: That if men are together in a boat, and one part of the company should weigh it down on one side, another would make it lean down as much to the contrary; it happens there is a third opinion, of those who conceive it would do as well if the boat went even without endangering the passengers.

*Marquis of Halifax, Character of a Trimmer*, Pref.

Коротко и ясно, без лишних слов.

the accepted teaching of Scripture (1), with reference to the Father, the Son, and the Holy Spirit, that each possesses the divine attributes and is worthy to receive divine worship, and (2), as opposed to every form of polytheism, that there is but one God. To harmonize these two propositions has been one of the problems of theology; and the church doctrine of the Trinity has been the result. The most ancient symbol in which the doctrine occurs a distinct statement of this doctrine is the Athanasian, in which it is thus stated: "We worship one God in Trinity, and Trinity in unity; neither confounding the Persons, nor dividing the substance." The term *Trinitas* is applied, however, in ecclesiastical literature to different philosophical explanations of the Biblical teaching. Some have held to a trinity of manifestation, one God revealing himself to mankind in three persons; some to a unity of will and a difference in other elements of being; others, again, to a subordination, though not an inferiority, of the Son to the Father, and of the Holy Spirit to the Father and the Son; others have attempted a mystical explanation of the Trinity, as, for example, the Swedenborgians, who hold that "the Father, Son, and Holy Spirit are three essentials of one God, which make one; just as the soul, body, and operation make one in man"; while still others have used language in explanation of the Trinity which makes it, as thus explained, approach tritheism—that is, the doctrine that there are three Gods. The received doctrine of the Christian church among Trinitarians may be fairly stated to be that we are taught by the Scriptures to believe that there is but one God, and yet three equal subjects in the one Godhead, who are described as persons, but that we are unable to determine in what sense these three are separate and in what sense they are united in one.

4. A symbolical representation of the mystery of the Trinity, frequent in Christian art. front, and the Holy Spirit, in the form of a dove, resting on the cross. The mystic union of the three persons has also been symbolized by various emblems or devices in which three elements are combined into one whole, as, for instance, by the equilateral triangle or a combination of the triangle, the circle, and sometimes the trefoil.

**II. n.** 1. In *classical antiqu.*, a seat, table, or other article resting on three feet. Specifically—(a) A three-legged seat or table. (b) A pot or caldron used for boiling meat, and either raised upon a three-legged frame or stand, or made with three feet in the same piece with itself. (c) A bronze altar, originally identical in form with the caldron described above. It had three rings at the top to serve as handles, and in many representations shows a central support or upright in addition to the three legs. It was when seated upon a tripod of this nature, over a cleft in the ground in the innermost sanctuary, that the Pythian priestesses at Delphi gave their oracular responses. The celebrity of this tripod, which was peculiarly sacred to the Pythian Apollo and was a usual attribute of him, led to innumerable imitations of it, which were made to be used in sacrifice; and ornamented tripods of similar form, sometimes made of the precious metals, were given as prizes at the Pythian games and elsewhere, and were frequently placed as votive gifts in temples, especially in those of Apollo. See cut on following page, and cut under *Pythia*.

After the Persian war the victors at Plataea dedicated as a thank-offering to the Delphic Apollo a gold tripod mounted on a bronze pillar composed of three intertwined serpents.

2. Hence, any object having three feet or legs, as a three-legged stool.

The trieme was provided with one, two, or three masts, which were unstepped when the vessel was not under sail. At first naval battles were simply contests of weight or force, and the victory fell to the trieme which had the greatest num-

ber of fighting men, or the best-disciplined, on board, nautical maneuvers being scarcely attempted. The Athenians, however, in the fifth century B. C., introduced very skilful naval tactics, and made hand-to-hand fighting by the marines subordinate to the attempt to disable the enemy's ship by ramming her amidships, or by crushing her banks of oars. The perfected trieme resembled more closely in theory and tactics the modern steam-ram than any form of ship that has intervened. It was long, narrow, and swift; the modern steam-engine was represented by the mechanical rowing of about 170 men, carefully trained, and under perfect command; and it was entirely independent of its sails, which were not hoisted unless, while cruising, the wind chanced to be favorable.

Thucydides writeth that Aminocles the Corinthian built the first trieme with three rows of oars to a side.

It is sung in the Greek Church at the Little Entrance (see *entrance*, *n.*), and occurs frequently in the Greek daily office. It is also found in almost all Eastern liturgies. In the West the Trisagion was used in the Gallican liturgy and in the Sarum prime. It is still sung in Greek and Latin at the Reproaches on Good Friday. The flowers are small, on the flexuous branches of a spreading, thick-stalked spadix with many obliquely split spathe. Several species are included among the fan-palms of greenhouse cultivation: *T. campocistis* is remarkable as one of the most southern of all palms, extending in the Argentine Republic to 32° 40' south, and is also peculiar for its woody leaves, more rigid than those of any other palm.

(Tournefort, 1700), < L. *triticeum*, wheat, < *terere*, pp. *tritrus*, rub, grind, thresh; see *trite*, *try*.] A genus of grasses, of the tribe *Hordeae*, type of the subtribe *Triticeae*. It is characterized by two- to five-flowered somewhat compressed spikelets solitary at the nodes, and by an oblong or ventricose five- to nine-nerved flowering glume, the lateral nerves not connivent. The genus includes the cultivated species or varieties of wheat, long diffused widely through all temperate regions, and from 10 to 15 species in the wild state, natives of the Mediterranean region and of western Asia. They are annual or biennial erect flat-leaved grasses, with a terminal elongated or cylindrical spike, its axis usually without joints, but flexuous with alternate excavations, into which the spikelets are set. For the polymorphous cultivated species *T. sativum* (*T. vulgare*), see *wheat*, *speltz*, *lyghorn*, *mummys-wheat*, and cut under *Monocotyledones*; and compare *amalcorn* and *Agilops*, 2. **Triton** (tri'ton), *n.* [< L. *Triton*, < Gr. *Τρίτων*, Triton; cf. Skt. *trita*, a superhuman being of uncertain origin and attributes.] 1. In *Gr.* and *Latin myth.*, a son of Poseidon and Amphitrite, who dwelt with his father and mother in a golden palace on the bottom of the sea, and was a gigantic and redoubtable divinity. In the later mythology Tritons appear as a race of subordinate sea-deities, fond of pleasure, and figuring with the Nereids

in the train of the greater sea-gods; they are conceived as combining the human figure with that of lower animals or monsters. A common attribute of Tritons is a shell-trumpet, which they blow to soothe the restless waves. And all the way before them [Neptune and Amphitrite], as they went.

*Triton* his trumpet shrill before them blew.

Spenser, *F. Q.*, IV. xi. 12.

So might I, standing on this pleasant lea,  
Have sight of Proteus rising from the sea,  
And hear old Triton blow his wreathed horn.

Most of the tritons of the Old World fall in the genus *Molge*, as the great marbled newt of Europe, *M. marmorata*, and the red-bellied, *M. alpestris*. The older harmonists regarded this interval, even when only suggested, as peculiarly objectionable, whence the proverb "*mī contra fa diabolus est*." See *mi*.

**Tritonia** (tri-tō-ni-ā), *n.* [NL., < L. *Triton*, < Gr. *Τρίτων*, Triton; see *Triton*.] 1. A genus of nudibranchiate gastropods founded by Cuvier in 1798, typical of the family *Tritoniidae*,

It is characterized by an ovoid or oblong capsule and by a slender perianth-tube not enlarged at the summit, with a concave or bell-shaped, regular or oblique border, upon the base of which the more or less unilateral stamens are inserted. There are about 34 species, all natives of South Africa. They are ornamental plants from a scaly or mostly solid and fiber-bearing bulb, producing a simple or slightly branching stem and a few narrowly linear or sword-shaped leaves, which are often falcate. The handsome yellow, orange, blue, or white flowers are sessile, and scattered along a simple or branching peduncle, each flower solitary in a short membranous spathe. They are known in cultivation by the generic name *Tritonia*, and sometimes by a former generic name *Montbretia*.

(a) A bird described by some ancient writers, as Herodotus, as a kind of wagtail or sandpiper which enters the mouth of the crocodile and feeds by picking the reptile's teeth. Many surmises have been made in the attempt to identify this bird. It is certainly one of the small plover-like birds of the region of the Nile, probably either the Egyptian courser, crocodile-bird, or siskia, *Pluvialis aquipennis*, belonging to the subfamily *Cursivinae* (see cut under *Pluvialis*), or the Egyptian spurt-winged plover, *Hypopteryx spinus* (see cut under *spin-winged*). I would have trial made of two other kinds of bracelets, for comforting the heart and spirits: the one of the *trochisk* of vipers, made into little pieces of beads; for since they do great good inwards, especially for pestilent agues, it is like they will be effectual outwards, where they may be applied in greater quantity. There would be *trochisk* likewise made of snakes, whose flesh dried is thought to have a very opening and cordial virtue.

Bacon, Nat. Hist. (ed. Montagu), § 965.

God finds out a way to improve their evils to advantage; and teaches them, of these vipers, to make sovereign cyretes and safe and powerful *trochises* (read *trochiskes*).

Bp. Hall, Balm of Gilead, xvii, § 4.

**trochite** (trō'kit), *n.* [< Gr. τροχός, a wheel, + -ite².] One of the disks or wheel-like joints of the stem of an encrinure; a wheelstone, screwstone, or entrochus. [Rare or obsolete.]

**trochiter** (trōk'i-tēr), *n.* [An arbitrary variant of *trochanter*.] The greater tuberosity of the head of the humerus, in man the site of the insertion of the supraspinatus, infraspinatus, and teres minor muscles. See *trochin*, and cut under *humerus*.

Hence ult. E. *truckle*.] In anat. and zool., a pulley or pulley-like arrangement of parts, affording a smooth surface upon which another part glides. Specifically—(a) A fibrous loop in the upper inner corner of the orbit of the eye, through which runs the tendon of the superior oblique muscle of the eyeball. The line of traction of the muscle is by this

contrivance deflected at nearly a right angle. This trochlea is not found below mammals. Similar loops (seldom, however, taking the name *trochlea*) bind down and alter the direction of some other double-bellied muscles, as the digastricus and omohyoid. See cuts under *eyel* and *eyeball*. (b) In the elbow-joint, the articular surface of the inner condyle of the humerus, with which the ulna articulates; distinguished from the capitulum, or outer convex surface for the articulation of the radius: so called because in man it is concave from side to side, though very convex in the opposite direction, thus affording a surface like that of the rim of a pulley-wheel. See cuts under *capitulum* and *epicondyle*. (c) In entom., the orifice of the metathorax through which passes the tendon of the abdomen, and whose smooth rim serves as a sort of pulley. Kirby and Spence.—Tibial trochlea. See *tibial*.

**trochlear** (trōk'lē-ār), *a.* and *n.* [< NL. *trochlearis*, < L. *trochlea*, pulley; see *trochlea*.] I. *a.*

1. Pulley-like; forming a loop that acts like a pulley for a tendon to run through, or affording a surface like that of a pulley, upon which a bone may ride back and forth. See *trochlea*.—2. In bot., circular, compressed, and contracted in the middle of its circumference, so as to resemble a pulley, as the embryo of *Commelina communis*. Also *trochleate*.—3. Pertaining to or connected with a trochlea: as, a *trochlear* muscle or nerve; *trochlear* movements.—Trochlear fossa, a small depression in the orbital plate of the frontal bone, situated near the internal angular process, for attachment of the trochlea of the eye.—Trochlear muscle, the superior oblique muscle of the eyeball, whose tendon runs through a trochlea. See cut under *eyeball*.—Trochlear nerve (nervus trochlearis), the fourth and smallest of the cranial nerves. Its superficial origin is just behind the corpora quadrigemina. It supplies the superior oblique muscle of the orbit. It is purely motor in its function. Also called *patheticus*, *oculomotorius superior*. See second cut under *brain*.—Trochlear spine. See *spine*.—Trochlear surface of the femur, the smooth depression forming the anterior part of the articular surface of the condyles, for articulation with the patella.

name, originating with French naturalists, of those American blackbirds (*Icteridae*) which go in flocks. They are mostly the marsh blackbirds, of the subfamilies *Ardreina* and *querculæna* as the cow-tropical, red-winged blackbird and crow blackbird or purple grackle. The term extends to the whole family, and thus includes the American orioles and hummingbirds, as the Baltimore and the orchard orioles. The bird here figured is one of the orioles, it is *le tropicale* of Brisson, the type species of his genus *Icterus* (see *Icterus*, 3), from which the family *Icteridae* is named. The male is jet-black and rich-yellow in large massed areas, varied with white on the wings. This tropical is native of tropical America, and is often seen in cages. See also cuts under *Ardreina*, *cuck-bird*, *crow-blackbird*, and *lark*.

**Tropæolum** (trō-pē'ō-lum), *n.* [NL. (Linnaeus, 1737), *< Gr. τροπαῖος*, of a turning or change: see *trophy*.] A genus of polypetalous plants, of the order *Geraneaceae*, distinguished from *Pelargonium*, the other genus of the tribe *Pelargonieae*, by its solitary ovules and indehiscent carpels without beaks. There are about 40 species, all natives of South America or Mexico. They are climbers or rarely diffuse herbs, bearing alternate lobed or dissected leaves which are petiolate or palmately angled. The flowers are red, orange, or yellow, rarely purple or blue. They are solitary in the axils, often on long peduncles, and are followed by a fruit of three rugose indehiscent carpels, pervaded by a pungent principle, as is the whole plant, and sometimes used as pickles. Many species are cultivated for ornament under the name *nasturtium*, especially *T. majus*, also known as *Indian cross* and *lark's-foot*. For *T. peruvianum*, see *canary-bird*, *under lark's-foot*. For *T. nasturtium*, 2, and *under canary-bird*.

**troparion** (trō-pā'ri-on), *n.*; pl. *troparia* (-ā). [*< LGr. τροπῆριον*, a modulation, short hymn, stanza, dim. of *τρόπος*, a musical mode.] In the *Gr. Ch.*, a short hymn or a stanza of a hymn. Cf. *tropes*, *trover*, *troubadour*.] 1. In *rhct.*, a figurative use of a word; a word or expression used in a different sense from that which properly belongs to it, or a word changed from its original signification to another for the sake of giving spirit or emphasis to an idea, as when we call a stupid fellow an ass, or a shrewd man a fox. Tropes are chiefly of four kinds: metaphor, metonymy, synecdoche, and irony; but to these may be added allegory, prosopopeia, hyperbole, antonomasia, and some others. Tropes are included under figures in the wider sense of that word. In a narrower sense, a trope is a change of meaning, and a figure any ornament except what becomes so by such change.

Is not the trope of music, to avoid or slide from the close or cadence, common with the trope of rhetoric, of deceiving expectation?

Bacon, Advancement of Learning, ii.

Wee acknowledge and beleeve the Catholick reformed Church, and if any man be dispos'd to use a trope or figure, as Saint Paul once did in calling her the common Mother of us all, let him doe as his owne rhetorick shall perswade him.

Milton, On Def. of Humb. Remonst.

Your occasional tropes and flowers suit the general coarseness of your style as tambour sprigs would a ground of linsey-woolsey.

Excessive thought, without anxiety, uses up the materials subservient to sensory excitation. . . . But excessive thought, with mental anxiety, care, and pain, as grief, is much more exhausting, and therefore more commonly followed by *trophesies*. E. C. Mann, Psychol. Med., p. 349.

**Trophis** (trō'fis), *n.* [NL. It is characterized by dioecious flowers, the female tubular and disposed in few-flowered spikes, the male in loose or interrupted spikes. There are 5 or 6 species, all American, occurring in the West Indies, Mexico, and the Andes. They are trees or shrubs with alternate petioled leaves, which are finely and conspicuously feather-veined and reticulated. The flowers are sessile or nearly so, their spikes solitary or twin in the axils, the fertile so, followed by a globose fleshy fruit closely united with the perianth-tube and crowned by its minute border. For *T. Americana*, see *ramoon*.

**trophoblast** (trōf'ō-blāst), *n.* [*< Gr. τροφή*, nourishment, + *βλαστος*, a germ.] An external epiblastic layer that does not enter into the formation of the embryo, but does take an active part in nutritive processes intended for it; the blastocystic ectoderm.

If we agree to drop all these [old names] where the lower mammals are concerned, and henceforth to designate the outer layer alone as *trophoblast*, the outer layer plus a thin layer of somatic mesoblast without blood-vessels as *diplotrophoblast* (= V. Baer's serous envelop), the portion of the *diplotrophoblast* against which the yolk-sac with its area vasculosa adheres as *omphalodean diplotrophoblast*, that against which the allantois does the same as *allantoidean diplotrophoblast*, then we have avoided misunderstandings that might arise from the indiscriminate use of the term *chorion*.

**trot**<sup>1</sup> (trót), *n.* [*< ME. trot, < OF. trot = Pr. trot = Sp. Pg. trote = It. trotto (G. trotti); from the verb.*] 1. Quick, steady movement; "go": as, to keep one on the trot all day. [*Now colloq.*]—2. A gait faster than the walk and slower than the run. In the trot of bipeds both feet are alternately off the ground at the same time for an interval in each step; in that of quadrupeds, in a very slow trot there is always one foot on the ground, a part of the time two feet, and a part of the time three. If fast, there are two intervals in each stride when all the feet are off the ground (the stride being the distance in time or space between the successive points on the ground touched by the same foot), the horse leaving the ground from the hind feet in succession, while in the run he leaves the ground from a fore foot. In the trot the limbs move in pairs, diagonally but not quite simultaneously, even in the "square trot." If the difference becomes considerable, it constitutes "single-footing"; if the difference becomes so great that the action is reversed, and the pair of limbs on the same side move together, it becomes "pacing." While the trot is naturally a slower gait than the run, it has become the instinctive fast gait in certain breeds of horses. See *trotter*, and cut in preceding column.

The canter is to the gallop very much what the walk is to the trot. *Youatt, The Horse* (Treatise on Draught).

of private feuds which was observed, chiefly in the eleventh

and twelfth centuries, in France, Italy, England, etc.

The terms of such a *truce* usually provided that such

feuds should cease on all the more important church festi-

vals and fasts, or from Thursday (evening to Monday

morning, or during the period of Lent, or the like. This

practice, introduced by the church during the middle

ages to mitigate the evils of private war, fell gradually into

disuse as the rulers of the various countries became more

powerful.

**Act.** (a) An English statute of 1831 (1 and 2 Wm. IV., c.

37) requiring wages of workmen to be paid in coin or cur-

rent money instead of goods. (b) A statute of 1870 (33

and 34 Vict., c. 105), also called the *Truck Commission Act*,

which appointed a commission to inquire into the work-

ing of the act of 1831.—**Truck system**, the practice of

paying the wages of workmen in goods instead of money.

This practice has prevailed in Great Britain and else-

where, particularly in the mining and manufacturing dis-

tricts, the masters establishing warehouses or shops on

which the workmen in their employment receive orders

from time to time for supplies of provisions, etc., the rest

of their wages, if any, being paid in money at the end of

the month, or in orders which may be discounted at the

store. In some instances the workmen receive payment

of their wages in money on a tacit or express understand-

ing that they are to resort to the premises of their mas-

ters for such necessities as they require. Under this

system the workmen have often to pay exorbitant prices

for their goods, and from the great facility afforded to

them of procuring liberal supplies of goods in anticipa-

tion of wages, they are apt to be led into debt. The system

was prohibited in Great Britain in 1831, by statute 1 and 2

William IV., c. 37, which requires that the wages of work-

men be paid in coin or current money, and not in goods.

The system, however, still flourishes more or less openly.

A musical wind-instrument, properly of metal, consisting of a

cup-shaped mouthpiece, a long cylindrical or a short conical tube, and a flaring bell. The tones are produced by the vibrations of the player's lips. The fundamental tone of the tube depends on its length, but by varying the force of the breath and the method of embouchure, a considerable series of harmonics can also be produced, so that the compass of the instrument extends to about four octaves, the tones in the upper part of the series lying close together. By the addition of a slide, like that of the trombone, or of valves, as in the cornet-à-pistons, or of finger-holes and keys, as in the key-bugle and the serpent, a large number of other tones can be secured, so as to give a very full and continuous compass, well adjusted as to intonation. The fundamental tone can be extensively varied in modern instruments by the

Orchestral Trumpet.

use of crooks. The trumpet is the typical instrument of a very numerous family of instruments, of which the horn, the bugle, the cornet, the trombone, the tuba, the euphonium, and the serpent are prominent members. The name *trumpet* itself has been applied to a large number of different instruments at different times. In ancient times two varieties were important—the one straight (the *tuba*), and the other curved (the *lituus*), the latter being often made of wood or horn. In the mediæval period the evolution of a great number of variants was rapid, with little emphasis on any one distinctively known as the trumpet. In the eighteenth century, and early in the nineteenth, the present orchestral trumpet reached its full development in a twice-doubled tube about five and a half feet long (or with the longest crook eight feet), without keys or valves, but with a short slide for correcting the intonation of certain of the upper tones and for adding intermediate tones. The artistic value of this instrument is great; but in most cases music written for it is now generally given to valve-instruments of the cornet kind, whose tone can never be as pure and true. The use of the trumpet was frequent with Bach and Handel, under the names *clarino* and *principale*. The instrument is most common now in works of a martial or festal character, but it is also useful for adding color to various combinations, especially with other wind-instruments. Music for the trumpet is traditionally written in the key of C, and the intended fundamental tone (to be obtained by the use of the appropriate crook) is indicated at the beginning, as "*clarino in F*" or "*tromba in E*." Instruments of the trumpet class have always been used for military purposes, especially for signaling and in military bands.

For we live in an age so sceptical that, as it determines little so it takes nothing from authority *on trust*.

*Drummond*, *Def. of Epul.* to 2d pt. Cong. of Granada.

Same. Taking things *upon trust*, misemploy their power, and are easily ensnared by the flatteries and denunciations of others.

*Locke*, *Human Understanding*, I. iv. § 22.

(b) Confidence in the ability and intention of one who does not pay ready money to pay at some definite or indefinite time in the future: as, to buy or sell *on trust*.

Even such is time; which takes in trust

Our youth, our joys, our all we have!

And pays us nothing but age and dust.

*Raleigh*, *Ellis's Spec. of Early Eng. Poetry*, II. 224.

I fear you must be forced, like the rest of your sisters, to run in trust, and pay for it out of your wages.

*Swift*, *Advice to Servants* (*Waiting-Maid*).

5. In law: (a) A confidence reposed in a person by making him the nominal owner of property which he is to hold, use, or dispose of for the benefit of another. (b) The right on the part of such other to enjoy the use or the profits or to require a disposal of the property for his benefit. (c) The relation between persons and property which arises when the legal ownership is given to one person, called the *trustee*, and the beneficial enjoyment or advantages of ownership are given or reserved to another, the *cestui que trust* or *beneficiary*. Property is sometimes said to be held in trust when the possession of it is intrusted to one person while another remains both legal and beneficial owner; but this is not technically a trust, although the person so intrusted in some respects may be held to the same duty and accountability as a trustee, and is sometimes spoken of as such.

The fictitious entities characterised by the two abstract terms *trust* and *condition* are not subaltern but disparate. To speak with perfect precision, we should say that he who is invested with a trust is, on that account, spoken of as being invested with a condition: viz. the condition of a trustee.

*Bentham*, *Introduct. to Morals and Legislation*, xvi. 26, note.

6. That which is committed or intrusted to one, as for safe-keeping or use. (a) That which has been committed to one's care for profitable use or for safe-keeping, of which an account must be rendered.

Although the advantages one man possesseth more than another may be called his property with respect to other men, yet with respect to God they are only a trust.

*Swift*.

The English doctrine that all power is a trust for the public good [was] . . . making rapid progress.

*Macaulay*, *Walpole's Letters*.

Public office is a public trust.

*Dorman B. Eaton*, in *Cyc. Polit. Science*, I. 479 (1851).

(b) Something confided to one's faith; a charge given or received in confidence; something which one is bound in duty and in honor to keep inviolate; a duty incumbent on one.

To violate the sacred trust of silence

Deposited within thee. *Milton*, *S. A.*, I. 428.

Humility obliges no Man to desert his Trust, to throw up his Privilege, and prove false to his Character.

*Jeremy Collier*, *Short View* (ed. 1698), p. 137.

"If men accept trusts they must fulfill them, my dear," cries the master of the house.

*Thackeray*, *Philip*, xv.

7. Specifically, in *mod. com. usage*, an organization for the control of several corporations under one direction by the device of a transfer by the stockholders in each corporation of at least a majority of the stock to a central committee or board of trustees, who issue in return to such stockholders respectively certificates showing in effect that, although they have parted with their stock and the consequent voting power, they are still entitled to dividends or to share in the profits—the object being to enable the trustees to elect directors in all the corporations, to control and suspend at pleasure the work of any, and thus to economize expenses, regulate production, and defeat competition. In a looser sense the term is applied to any combination of establishments in the same line of business for securing the same ends by holding the individual interests of each subservient to a common authority for the common interests of all. It is against public policy for a stockholder to divest himself of his voting power; hence such a transfer of stock if made is revocable at the pleasure of the maker. So far as the object of such a combination is shown to be the control of prices and the prevention of competition in the necessities or conveniences of life, it is held a criminal act upon the principles which rendered engrossing and forestalling punishable; and a corporation which by corporate act surrenders its powers to the control of a trust thereby affords ground for a forfeiture of its charter by the state.

8. The state of being confided in and relied on; the state of one to whom something is intrusted.

I do profess to be no less than I seem; to serve him truly that will put me in trust.

*Shak.*, *Lear*, i. 4. 15.

It seems when he was deputy in Ireland, not long before, he had been much wronged by one he left in trust with his affairs.

*Evelyn*, *Diary*, Oct. 27, 1675.

9. The state of being confided to another's care or guard; charge.

His seal'd commission, left in trust with me,

Doth speak sufficiently he's gone to travel.

*Shak.*, *Pericles*, i. 3. 13.

10. Keeping; care.

That which is committed to thy trust.

1 Tim. vi. 20.

11†. Trustworthiness.

A man he is of honesty and trust.

*Shak.*, *Othello*, I. 3. 285.

In suits which a man doth not well understand, it is good  
to refer them to some friend of *trust* and judgment.  
*Bacon, Suits* (ed. 1887).

There is not  
In any court of Christendom a man  
For quality or *trust* more absolute.  
*Ford, Love's Sacrifice*, i. 2.

**Active or special trust** (in *Scots law* called *necessary trust*), a trust in which the trustee is clothed with some actual power of disposition or management which cannot be properly exercised without his having the legal estate and right of actual possession: as distinguished from a *simple trust, naked trust, or passive trust* (in *Scots law* called *proprietary trust*), where the trustee is intended to be merely a figurehead to hold the apparent title, leaving the use or control to the beneficiary. Naked or passive trusts in land are now generally superseded by the rule (introduced originally by the statute of uses (see *use*), and extended in the United States by statutes of trusts) that, when a person attempts to create such a trust, no estate vests in the trustee, but the entire and absolute estate vests in the intended beneficiary.—**Breach of trust.** See *breach*.

—**Charitable Trusts.** See *charitable*.—**Constructive trust**, the legal relation similar to an express trust which arises upon circumstances which ought in equity to be dealt with as if there were a trust, irrespective of whether one was intended or not: thus, where a guardian transfers property of the ward without receiving an equivalent, the person receiving it may be made accountable as holding in trust for the ward by construction of law, irrespective of whether he intended to receive it for the ward's benefit or not.—**Declaration of trust.** See *declaration*.—**Deed of trust.** See *deed*.—**Executed trust.** (a) Technically, an express trust the objects and administration of which are so fully designated as to require no further act on the part of the creator of the trust to define the duty of the trustee, as distinguished from an *executory trust*, or one in which the instrument of creation reserves the declaration of the uses or some part thereof for further instructions. (b) A trust is also said to be *executed* when the trustee has performed his entire duty. (c) When the instrument creating a trust in land has the effect by virtue of the statute of uses of vesting the entire estate in the intended beneficiary, the trust is said to be *executed* by the statute.—**Express trust**, a trust which is created or declared in express terms, and usually, but not always, in writing, as distinguished from an *implied trust*, or one the existence of which is inferred from the conduct of the parties or the circumstances of the case. The phrase *implied trust* is sometimes loosely, but not improperly, applied to those constructive trusts in which there may be circumstances indicating that perhaps the parties intended a trust rather than a fraud.—**Implied trust.** See *express trust*.—**In trust**, as a trust; as a charge; for safe-keeping, or for the use of another to whom account is due.—**Loan and trust company.** See *bank*, 2. 4.—**Naked trust**, a nominal or ostensible trust; a trust in which the trustee is not clothed with the right of possession or control. By the statute of uses, such trusts in land are executed, that is to say, the legal title is declared by law to be in the beneficiary, who has the right of possession and control, notwithstanding the contrary intent of the instrument creating the trust.—**On trust**, on credit; without present payment or security for payment: as, to buy on trust; to conduct one's business on trust.—**Passive trust.** See *active trust*.—**Private trusts.** See *private*.—**Proprietary trust.** See *active trust*.—**Public trust.** See *public*.—**Resulting trust**, a trust which is conclusively implied by rules of law from given circumstances; more specifically, that species of constructive trust which arises in favor of one who pays the price for real property on its conveyance to another. When one person obtained title to land for a consideration paid by another, the courts of chancery thus held the former to be a trustee of the property for the latter. By statute in many of the United States this result is precluded, except where the person paying is ignorant that the title is so taken, or where the claim to reach the property is made by his creditors.—**Special trust.** See *special*.—**Spendthrift trust**, a trust authorizing the trustees to pay the income for life to one person, the principal being given over to another on his death: so called under systems of law, as in Pennsylvania, which protect such income against claims of creditors.—**To run in trust**, to run in debt; get credit. *Webster*.—**Trust certificate**, one of the certificates issued by the committee of trustees formed for the control of several corporations, showing the interest on profits accepted by one who was a stockholder in one of such corporations, upon surrendering his stock. See *def.* 7.—**Trust deed**, a conveyance in trust. More specifically (a) A deed by a debtor conveying property to a person as trustee for payment of his debts. (b) A deed conveying property to a creditor in trust to sell and pay himself and restore the residue: a kind of mortgage.—**Trust estate**, an estate under the management of a trustee or trustees; or an estate given to be held in trust.—**Trust ex maleficio**, any constructive trust arising by reason of wrong-doing or intentional fraud on the part of the person charged as trustee, as where an attorney obtains title to his client's property in violation of duty.—**Syn.** 1 and 2. Faith, credence, assurance, dependence, expectation.

paper stencils, in which the stencils are formed by placing  
the paper sheets on a flat steel surface, uniformly cut after  
the manner of a file, and writing upon them with a stylus.  
The paper is thus minutely perforated under the marks  
made by the stylus. The stencils are used in the same  
way as ordinary stencils for reproducing the written text.

**Tsuga** (tsū'gū), *n.* [NL. (Carrière, 1855), < Jap. *tsuga*, the name of *T. Araragi*, lit. 'yew-leaved' or 'evergreen,'] 1. A genus of coniferous trees, of the tribe *Abietineae*, including the hemlocks, and intermediate between *Picea*, the spruce, and *Abies*, the fir. Its staminate flowers and its seemingly two-ranked flat linear leaves resemble those of *Abies*, but it agrees with *Picea* instead in its persistent petiole-bases and in its reflexed cones with persistent scales. The 6 species are evergreens with slender flat or often pendulous branchlets, and narrowly linear leaves, flat above (convex or keeled in *T. Pattoniana*), and spirally inserted, but spreading in two ranks. The main branches are mostly horizontal, and are irregularly inserted, not whorled as in the fir and spruce. They are tall trees (excepting *T. Caroliniana*), reaching 80 to 100 feet high, with large cylindrical trunks and thick brown bark, which is deeply ridged within. The cones are small and brown, an inch or less long, or in *T. Pattoniana* cylindrical and 2 or 3 inches long; in this and in *T. Mertensiana* they are bright-purple until ripe. Two species are found on the Atlantic and 2 on the Pacific side of North America, and 2 in Asia. In each case one of the two species is interior, alpine, and more or less local, while the other is more wide-spread, and approaches the coast. *T. Canadensis*, the hemlock-

silvery beneath, and hung with small oval brown cones about the ends of the branches. (See cut under *imbriaticæ*.) In middle life the long-persistent dead lower branches often render it unsightly, and impair the value of the wood. *T. Caroliniana* is the Carolina hemlock, a small and rare tree of dry rocky ridges in the Carolinas, having larger, glossier, blunter leaves, and larger cones with wide-spreading scales. *T. Mertensiana*, the western hemlock, forms large forests in Oregon, extending to Montana and Alaska; it yields the principal tanning-material of the northwestern States and a coarse inferior lumber; it exceeds the eastern species in its size, being sometimes 150 feet high and 12 feet in diameter. *T. Pattoniana*, the alpine spruce, occurring locally from British Columbia to California, sometimes 7 feet in diameter, peculiar in the deflexed base of its spreading branches and its finer satiny wood, is exceptional in the genus in its scattered quadrangular leaves, with the persistent petiole-base hardly prominent, two-lobed pollen-grains like those of pines, and large leather-brown cones with their scales reflexed. It is therefore separated by Lecomte (1890) as a genus, *Hesperopicea*. *T. Aranoi* (*T. Sieboldii*) of Japan, the original species, forms large forests on Fusi-yama and other

The word was also applied, however, to a larger division, consisting of three or four, or even more, *Tuaths*, called a *Mór Tuath*, or great *Tuath*, which were associated together for certain legal and legislative purposes, and the troops of which were united together in war under one commander.

Bp. Bob, *Comedy Concerning Three Laws*. (Nares.) You shall see in us that we preached no lies, nor tales of tubs, but even the true word of God.

Japanese camphor is distinguished from Formosan by being coarser grained, clearer, of pinker hue, and by subliming at a lower temperature. It is also known as "Dutch" or "tub" camphor, the latter name arising from its being imported to Europe in tubs covered with matting, each placed within a second tub secured on the outside by hoops of twisted cane. **tuba** (tū'bā), *n.*; pl. *tubæ*, *tubus* (-be, -būs). [L., a trumpet; see *tube*.] 1. A musical instrument of the trumpet family,

of very large size and low pitch. It is essentially similar to the bombardon, though not always made in the same shape. Its compass is nearly four octaves, including, by means of three or five valves, all the chromatic tones. The fundamental tone is usually the third F or E<sub>2</sub> below middle C. Lower varieties are often called *bass* or *contra-bass tubas*. The tuba is much used in military bands, and is more or less common in the orchestra, where it is used in conjunction with the trombones.

2. In *organ-building*, a reed-stop of large scale, so connected with a separate bellows with extra weights that the tones are of exceptional power and majesty. Usually called *tuba mirabilis*.—3. In *anat.* and *zool.*, a tube or tubular part or organ; specifically, the Eustachian tube, or salpinx. See *hydra tuba* (under *hydra*), and cut under *scaphistoma*.—Bass tuba, a musical instrument, the largest of the trumpet family, and the deepest and most sonorous member of the brass wind division of the orchestra, having a large and long metal tube and five valves: its compass is about four octaves from the fourth A below middle C. —3. In *mining*, a method of keeping out the water in sinking a shaft in very watery ground; also, the material employed for this. It consists in providing a water-tight lining for the shaft, which is inserted piece by piece as the sinking progresses, thus reducing the extent of surface from which the water enters the shaft as quickly and as completely as is possible. Tubbing was formerly usually made of oak timber in France, where this method of sinking was first introduced; but iron has been employed in England, in the form both of segments of cylinders and of complete rings. Tubbing of masonry has also been used in England and Germany. 4. The act or process of bathing or of being bathed in a tub; a tub-bath.

Tom Brown, *Works*, III. 198. (Davies.)

**tube** (tüb), *n.* [F. *tube* = Sp. Pg. *It. tubo*, < L. *tubus*, a pipe, tube; cf. *tuba*, a trumpet.] 1. A pipe or hollow cylinder, especially when of small size and used as a conduit for liquids, or for containing liquids, as in some forms of scientific apparatus. Mechanically there is no distinction between a *pipe* and a *tube*; but in use the two words are often somewhat arbitrarily distinguished. Thus, when the form of the thing is chiefly considered, *tube* is regularly used: as, a steam-boiler having the shape of a large tube—not *pipe*; so, also, with reference to certain mechanical uses one word or the other is exclusively used: as, a gas-pipe, a drain-pipe, a test-tube. The words are also distinguished in use, but less clearly, according to the material employed: as, an iron *pipe*, a rubber *tube*, a brass *tube*, etc.

In *anat.* and *zool.*, a hollow tubular organ; a pipe, canal, or duct conveying fluid or gas; especially, a pipe which seems to be empty—that is, conveys air: as, the bronchial *tubes*; the Eustachian *tube*. An artery or a vein is a tube, but nearly if not all the structures which convey special fluids receive distinctive names. See *tub*, *tubule*.

In *bot.*, a subterranean body, usually of an oblong or rounded form, consisting morphologically of a stolon-like branch of a rhizome, much thickened, commonly at the end, and beset with "eyes," which are properly modified axillary buds. Some of these buds normally sprout the second season, giving rise to a new plant, for the nourishment of which the tuber is richly stored with starch. Typical examples are the common potato and the Jerusalem artichoke (see *Helianthus*, with cut); less familiar are the tubers of the dwarf dandelion (*Krigia Dandelion*), the American ground-nut (*Apios tuberosa*), and the ground nut of Great Britain, *Conopodium denudatum* (*Bunium flexuosum*). Corsi defines *tufo* as being similar in composition to *peperino*, but bearing the marks of having been transported by and deposited from water. The *tophus* of Vitruvius and Columella was of volcanic origin; that of Virgil and Pliny was calcareous. The *tufo* of the Italians, at the present time, is volcanic, and is the same rock which was designated by the Romans as *lapis ruber*; it closely resembles *peperino* (the *lapis Albanus* of the Romans), and

**tula-work** (tö'lä-wérk), *n.* Niello; niello-work; a kind of decorative work somewhat similar to enameling, done chiefly on silver. Niello-work has been long known, and is described by Pliny, by whom its invention is attributed to the Egyptians. It differs from enamel in that this latter is a vitreous compound, while niello is a combination of sulphur with silver, copper, and lead, the relative proportion of the ingredients, as given by different authors, varying greatly. The composition of niello, according to Pliny, is a compound of silver with one of copper, and no lead. All the more modern recipes demand less silver and some lead, the quantity of the precious metal diminishing from century to century. Benvenuto Cellini gives one sixth silver, one third copper, and one half lead as the composition of niello. The above has reference to the metallic ingredients of this article; in its manufacture sulphur is generally added in excess, that which is not taken up by the metals being volatilized in the process, which is performed in a crucible, a little sal ammoniac being used as a flux. Niello-work has been done in Russia for many years, and especially at Tula, which is the best-known locality for this branch of decorative art, although it is said that more artistic specimens are turned out at other places in that country. Niello is called in Russia "black silver." See *niello*.

1. A plant of the genus *Tulipa*, of which several species are well-known garden bulbs with highly colored bell-shaped flowers, blooming in spring. The common garden tulips are derived chiefly from *T. Gesneriana*, a native of central and southern Europe and adjacent parts of Asia, having shining scarlet flowers with purple-black spots at the base of the divisions, or a partly yellow claw. Varieties of this species have been developed with great care, especially in the Netherlands, the seat at one time of a "tulipomania." The catalogue of a Haarlem florist of recent date offered 1,800 varieties. They are divided into four classes: namely, "breeders" or "self-flowers," with the natural plain color; "bizarres," having a clear yellow ground with red, brownish, maroon, or purple markings; "bybliemens," with a white background marked prevailingly with red or shades of purple; and "roses," with white background variegated with shades of rose-color, deep-red, or scarlet. It is said that when a self-tulip once "breaks," the new variety remains always the same. Another long-cultivated tulip is the Duc Van Thol, *T. suaveolens*, with fragrant scarlet, yellow, or variegated flowers, early, and especially suited for pot-culture and forcing. *T. præcox*, having scarlet flowers with large black-purple spots surrounded with yellow near the base, also affords varieties. Less conspicuous or less known species are *T. Oculus-solis*, the sun's-eye tulip, with a brilliant scarlet perianth, having black spots at the base of the segments; *T. australis* (*T. Obscurus*), with bright-yellow flowers smaller than the common kinds; *T. Clusiana*, low and delicate, having the three inner divisions pure white, the three outer stained with pink; *T. pulchella*, type of a group of very pretty dwarf species; and *T. Greigi*, the Turkistan tulip, one of the most showy and desirable of all known tulips, bearing goblet-shaped flowers, commonly of a vivid orange-scarlet hue, also purple or yellow, from 4 to 6 inches broad when fully expanded.

2. In *ordnance*, a bell-shaped outward swell of the muzzle of a gun, as a rule abandoned in modern ordnance.

The armament of the Collingwood consists of four 45-ton steel breech-loading guns, 27 ft. 4 in. long, and gradually tapering from a diameter of 4 ft. 7 in. at the breech to 17 in. near the muzzle, which possesses what artillerists call a *tulip* or "swell."

It is characterized by flowers which are usually erect, bell-shaped, and marked by spots near the base, but without nectar-bearing glands; and by oblong, linear, erect, basixed anthers. There are about 50 species, natives of Europe and Asia, extending from England to Japan, and southward into northern Africa. Tulip-marts were established in various towns, where roots were sold and resold as stocks on the exchange. A single root of *Semper Augustus* was sold for 13,000 florins. After several years the government found it necessary to interfere.

A tree believed to be identical with it is found in China. The wood is soft, fine, and straight-grained, and is easily worked; it is used in construction and for inside finish, cabinet-work, pumps, woodenware, etc. The bark, especially of the root, is acrid and bitter, and is used domestically as a stimulant tonic. The tulip-tree is quite hardy, and is a much-admired shade and ornamental tree. Its timber, or the tree itself, is known as *whitewood*, though the wood turns yellowish on exposure, and as *poplar*, *tulip-poplar*, or *yellow poplar*. An old name, *saddletree* or *saddle-leaf*, refers to the form of the leaf; another, *canoe-wood*, to the use in which it was found among the Indians. The present name (the best of the common names) has reference to the flowers, which in form and size resemble a large tulip, the petals greenish-yellow marked with orange. See *Liriodendron* (with cut).

They are classed in two series, those bred to flight and those bred to color. The former are the ordinary or flying tumblers, most noted for their performances in mid air; some are even trained to tumble in a room. Tumblers bred to color without special reference to their flight are of many strains, known by color-names, *black, red, or yellow mottle, red or yellow agate, almond splash, etc.*

A considerable volume of water is thus suddenly discharged at each tilting of the receiving vessel, although the stream affording the supply may be small.

Chemical symbol, W; atomic weight, 183.5. A metal some of whose ores have long been known (see *wolfram* and *scheelite*), but they were supposed to be compounds of tin. That *scheelite* (tungstate of lime) was a compound of lime with a peculiar metallic acid was proved by Scheele and Bergmann in 1781, and the composition of wolfram was also determined by the brothers D'Elhuyar a few years later. Metallic tungsten, as obtained by the reduction of the trioxide, is a gray powder having a metallic luster and a specific gravity of 19.129 (Roscoe). The most interesting fact in regard to tungsten is that tungsteniferous minerals, especially wolfram, are very frequent associates of the ores of tin. (See *wolfram*.) Tungsten has been experimented with in various ways, as in improving the quality of steel by being added to it in small quantity; but no alloy containing tungsten has come into general use. (See *tungsten steel*.) A new alloy called *sideraphite*, containing a large percentage of iron, with some nickel, aluminum, and copper, together with 4 per cent. of tungsten, has recently been introduced; this is said to resemble silver, and to be very ductile and malleable and not easily attacked by acids. Another alloy called *minargent*, consisting chiefly of copper and nickel, is said sometimes to contain a small percentage of tungsten. Tungsten is chemically related to molybdenum and uranium. Certain chemically remarkable compounds of tungsten (tungstates with tungsten dioxide) have been employed as substitutes for bronze-powder.

5. A tunnel-net.—6. An arched drain. [Prov. Eng.].—7. A gallery, passage, or roadway beneath the ground, under the bed of a stream, or through a hill or mountain. Tunnels are used in military operations, in mining, in conveying water, and as passageways for vehicles and railway-trains. They are of various construction, according to the character of the soil or rock through which they pass. In soft silt or sand, as in subways beneath a stream, the interior of the tunnel is lined with brickwork, with, in some instances, a shield of plate-iron outside the bricks. In soil, soft rock, or quicksands, heavy masonry lining is sometimes required. In solid rock, a simple excavation is generally sufficient, as in many of the shorter railroad-tunnels. The section of a tunnel is usually a cylindrical or elliptical arch, with sometimes, in soft soils, an inverted arch below. The earlier modern tunnels were excavated by hand-drilling and blasting; but machine-drilling, by means of compressed air, has been brought to great perfection, and the rate of progression has been increased and the cost of excavation reduced. In the Greathead system of tunneling, the tunnel is made by

The shell is made of segments bolted together. Silt and mud are forced through doors in the face of the shield, and excavated material is taken out through air-locks in the bulkhead of the tunnel. The true tunny of the Mediterranean and Atlantic waters has been the object of an important fishery, systematically conducted from remote antiquity, as by the Phenicians, to the present day. It is one of the largest food-fishes, growing to a length of 10 feet, and acquiring a weight of one thousand pounds or more. It is a near relative of the bonito and albacore, but is distinguished from the latter by the much shorter pectoral fins; the body is deepest about the middle, whence it tapers rapidly to a slender caudal peduncle; there are eight or nine short separate finlets behind the dorsal and anal fins; the dorsals are two, of which the first rises high in front; the caudal fin is very short, but its upper and under lobes extend high and low. The color is dark-bluish above, and below grayish, irregularly silvery. The tunny is a fish of the high seas, but periodically wanders in large shoals coastwise. The flesh is eaten fresh, or preserved in salt or in oil.

**Turbellaria** (tér-be-lā'ri-ä), *n. pl.* [NL., so called in allusion to the currents caused by their

moving cilia; < *L. turba*, a crowd, + *-ella* + *-aria*.] A class of worms, or an order of flatworms, characterized by the ciliation of the body, by means of which they set up little currents or vortices of water: the whirl-worms. The name was given in 1831 by Ehrenberg to worms which had long been known as *planarians* (see *Planorida*), and was a mere substitute for or synonym of the earlier designation. It has been given with various extensions and restrictions, and has included the nematode or segmented thylacohous tubellarians (see *Nematozoa*). These are now excluded, and the *Turbellaria*, as an order of flatworms, are those whose body is ciliated and which have a mouth and with few exceptions an alimentary canal, but no anus. Most of them fall in the two main divisions of Platyhelminths and dendrocolous tubellarians, according to the simple or branched condition of the alimentary canal. They are mainly free-swimming worms, some of microscopic size, others several inches long; some forms inhabit fresh and others salt water. Turbines are usually horizontally rotating wheels on vertical shafts. They are of various constructions, and may be divided into *reaction turbines*, or those actuated substantially by the reaction of the water passing through them (their buckets moving in a direction opposite to that of the flow); *impulse turbines*, or those principally driven by impact against their blades or buckets (the buckets moving with the flow); and *combined reaction and impulse turbines*, which include the best modern types of turbines. They are also distinguished, by the manner in which they discharge the water, into *outward*, *vertical*, or *central-discharge wheels*. In some types of turbines the discharge is partly vertical and partly central. Such is the case with the wheel shown in the cut, which is constructed and set so that the water enters at the perimeter of the case. By the modern turbine a very high percentage of the potential energy of water is converted into work while passing through the wheel. Compare cut under *scroll*.—**Air-turbine**, a wheel of turbine form driven by wind, or air ejected from a pipe or tube.—**Journal-turbine**, a turbine having a downward discharge, as distinguished from those in which the discharge is outward, oblique, combined, etc.

In the strictest sense, the family is limited to tropical species having a pyriform or obconic shell with several transverse columellar plaits, and the radula with one median tricuspid tooth and lateral bicuspid teeth whose inner cusp is larger than the outer cusp. The principal genus, besides the type, is *Cynodontia* (or *Vasum*). Also called *Vasidae*.

It also shows the upper and central discharge-buckets *p*, and the lower and vertical discharge-buckets *q*.

The Hind. name is *peru*, perhaps referring to its American ('Peruvian') origin. The Ar. name in Egypt is *dik rūmī*, 'fowl of Turkey.'] 1. An American gallinaceous bird of the genus *Meleagris*; any species of *Meleagris*. See the technical names.

Turkeys are of two totally distinct species: one of these has two varieties, both widely known and with a long intricate history; the other species is practically unknown, except in ornithology. (a) The turkey now living wild in Mexico, and everywhere domesticated, became known to Europeans almost immediately upon the discovery of Mexico by the Spaniards in 1518. It was described by Oviedo, in or about 1527, as already domesticated among Christians and elsewhere than in New Spain (Mexico); it was called *pavo*, and the strutting of the gobbler with stiffly erect spread tail, like that of the peacock, was noted. It is traditional, and not incredible though unproved, that the turkey reached England in 1524, and certain that it was established in domestication in Europe by 1530. There is English documentary evidence of the turkey in 1541; the bird was first figured, both by Belon and by Gesner, in 1555; and by 1575 it had already taken up its since established connection with Christmas festivities. It is quite probable, but not in evidence, that there were other and very early (perhaps the earliest) European importations of turkeys from New England; if so, the domestic bird would be a composite of the two feral varieties noted below. From Gesner on, for about 200 years, the usual technical name of the turkey was *gallopavo* (with variants *gallopavus* and *gallopava*, sometimes *paragallus*, and qualified as *gallopavo sylvestris*, *gallopavo cristatus*, simulating a modern binomial). But meanwhile, by some confusion with the African guinea-hen, the exact date and occasion of which are open to conjecture, the turkey as domesticated in Europe was called *meleagris* (so Charleton, "Exercitationes," 1677, and on to Linnaeus, "Fauna Suecica," 1746). These two synonyms thus ran parallel for many years, till in the Linnaean "Systema Naturae," 1758, they were united in the onym *Meleagris gallopavo*. There had not then been, nor was there for some time afterward, any suspicion that two different species, or well-marked feral races, of the turkey existed in America (both covered by the term *M. gallopavo*). One of these, the ordinary wild turkey of the United States, was first technically specified by William Bartram, in 1791, as *M. americana*, and was soon after

twice renamed by Vieillot, as *M. sylvestris* and *M. fera*. The other of these, native in Mexico, and also extending into adjoining regions of the United States, was by John Gould, in 1856, specified as *M. mexicana*. This renaming accentuated the actual distinctions between the two kinds of turkeys, and also the fact, not before made prominent, that Gould's Mexican species was more like the ordinary domestic bird than like the feral bird of the United States. Hence *M. mexicana* is latterly taken to be a mere synonym of *M. gallopavo*, which latter name, as based mainly or wholly upon domesticated descendants of the Mexican

twice renamed by Vieillot, as *M. sylvestris* and *M. fera*. The other of these, native in Mexico, and also extending into adjoining regions of the United States, was by John Gould, in 1856, specified as *M. mexicana*. This renaming accentuated the actual distinctions between the two kinds of turkeys, and also the fact, not before made prominent, that Gould's Mexican species was more like the ordinary domestic bird than like the feral bird of the United States. Hence *M. mexicana* is latterly taken to be a mere synonym of *M. gallopavo*, which latter name, as based mainly or wholly upon domesticated descendants of the Mexican

This well-known and very useful bird is abundant in most of the States, extends northward to Canada, and in the Southern States is often found so far west as the Rocky Mountains. It is from 27 to 31 inches long, and about 60 inches in extent of a blackish-brown color, blacker on the wings and tail, and grayish on the wings above; the whole head is bare of feathers, and of a redish color ranging from livid crimson to pale carmine in the adults; the beak is white; the feet are flesh-colored, and the eyes brown. The naked skin of the head is wrinkled and sparsely bristled; the feathers begin in a circle around the upper part of the neck, and do not run up in a point on the hindhead as in the black vulture. Though ill-favored and bad-smelling when in hand, on the wing the turkey-buzzard is one of the most graceful of birds, soaring and sailing with a strong and buoyant flight on motionless pinions, and affording one of the best examples of this kind of flight. It nests on the ground or near it in hollow stumps and logs, and lays usually two eggs, white or creamy, boldly spotted and blotched with shades of rich brown and neutral tints. The young hatch clothed with whitish down. This vulture has the trick of "playing possum" when captured. The question whether it feeds its food by scent or sight, or both, is still discussed. See *cat* under *Cathartes*.

Ready to burst with pride.

It was simply constructed of rails forming four sides and a top, with a low entrance at one place to admit the birds, which were lured by sprinkling corn to some distance from the opening, as well as inside the inclosure. There was no special contrivance to prevent exit, as the efficiency of the trap depended on the fact that the turkeys, on finding themselves shut in, would carry their heads too high to notice the place through which they had crept to pick up the corn.

**Turlupin** (tér'lū-pin), *n.* [OF., appar. a particular use, in contempt, of *turlupin*, "a grub, mushrome, start-up, new-nothing man of no value" (Cotgrave, ed. 1611); origin unknown.] In *eccles. hist.*, a name given to the members of a French sect of about the fourteenth century, which held views very similar to those of the Brethren of the Free Spirit.

The *Turlupins* were first known by the names *Beghards*, or *Beghins*, and brothers and sisters of the free spirit. The common people alone called them *Turlupins*, a name which seems obviously to be connected with the wolfish howlings which these people, in all probability, would make in their religious ravings. Their subsequent name of the fraternity of poor men might have been the cause why the wandering rogues, called *Bedlam* beggars, assumed or obtained the title of *Turlupins* or *Turlygoods*, especially if their mode of asking alms was accompanied by the gesticulations of madmen.

The rhizome of *Curcuma longa*, a plant of the ginger family, native and long cultivated in the East Indies. It has a central ovoid body and lateral elongated tubers, called respectively *round* and *long turmeric*, formerly supposed to come from different species. *Turmeric* is of a deep brownish or greenish yellow, inwardly orange, of a resinous consistence and peculiar aromatic odor. It is prepared for use by grinding. In India it is most largely employed as a condiment, particularly as an ingredient in curry-powders. It has the property of an aromatic stimulant, and is there given internally for various troubles,

and applied externally for skin-diseases. In western countries its chief use (now declining) has been that of a dye-stuff, in which capacity it affords beautiful but fugitive shades of yellow; at present a leading use is in the preparation of a test-paper called *turmeric-paper* or *curcuma-paper*. The coloring matter is called *curcumin*; and the oil to which its aromatic taste and smell are due, *turmeric-oil* or *turmerol*. Sometimes called *Indian saffron*. The Hindu name is *hulbe*.

The turn-table for turning locomotives, as at the end of local lines, is now usually simply a wooden or iron girder, pivoted at the center and having each end supported on wheels that move on a circular track in a pit, the platform being dispensed with. **turpentine** (tér'pen-tin), *n.* [Formerly also *terpentine*; *< ME. turpentyne* = MD. *terpentijn*, *termentijn*, D. *terpentijn* = G. Sw. Dan. *terpentin*, *< OF. turbentine*, *terebentine*, *turpentine*, *terebenthine*, ML. *terebintina*, NL. *terebinthina*, *turpentine*, *< L. terebinthina* (sc. *resina*), fem. of *terebinthus*, of the terebinth, *< terebinthus*, *< Gr. τερεβινθος*, terebinth: see *terebinth*, and cf. *terebinthine*.] 1. An oleoresinous substance secreted by the wood or bark of a number of trees, all coniferous except the terebinth, which yields Chian turpentine. It consists chiefly of an essential hydrocarbon oil (C<sub>10</sub>H<sub>16</sub>) and a resin called *colophony* or *rosin*. The common turpentine is derived in France from the maritime pine, *Pinus maritima* (French or Bordeaux turpentine); in Russia and Germany, from the Scotch pine, *P. sylvestris*; in Austria and Corsica, from the Corsican pine, *P. laricio*; in the East Indies and Japan, from several pines; and in the United States, most largely in North Carolina, from the southern or long-leaved pine, *P. palustris*, and somewhat from the loblolly-pine, *P. taeda*. For other turpentines, see the phrases below. In the United States turpentine is obtained by cutting a pocket in the side of the tree (boxing), whence it is periodically collected. In France the less destruc-

tive method is practised of removing a piece of bark and conducting the flow into earthen vessels. The crude turpentine is subjected to distillation, separating the oil, or so-called spirit or spirits of turpentine, from the rosin—the oil in the case of the long-leaved pine constituting, it is said, 17 per cent., and in the case of the maritime pine 24 per cent. This when pure is limpid and colorless, of a penetrating peculiar odor, and a pungent bitterish taste. Spirit of turpentine is very extensively used in mixing paints and varnishes. In medicine it is stimulant and diuretic, an anthelmintic, and externally a rubefacient and counter-irritant.

Men sellen a Gome, that Men clepen *Turbentyne*, in stede of Baume; and thei putten there to a litlelle Bayme for to geven gode Odour.

During the American civil war, turpentine of the common sort was obtained from the Canadian red pine, *Pinus resinosa*.—**Carpathian turpentine**, usually called *Carpathian balsam*, a turpentine from the Swiss stone pine, *Pinus Cembra*.—**Chian turpentine**, the product of the turpentine-tree (which see), obtained by incision. It is of a feebly aromatic and terebinthinous flavor, not bitter or acrid, and of a characteristic pleasantly aromatic and terebinthinous scent. It was formerly of medicinal repute, then fell nearly into disuse, but latterly has been used with some success for cancer. Also *Cyprian* or *Scio turpentine*.—**Hungarian turpentine**, the product of the dwarf pine, *Pinus Pumilio*, usually called *Hungarian balsam*, an article scarcely met with in commerce. See *ointment*.—**Venetian** or *Venice turpentine*, the oleoresin of the European larch, *Larix Europæa*, secreted chiefly in its sapwood. It is less siccative than any other kind. 2. The detachable segment of the cylinder of a rotary printing-machine which contains the types or plates to be printed: so called from its curved surface. The types are made up on the curved surface, and firmly held in place by rebated column-rules, thicker at the top than at the bottom, and firmly grooved in the turtle. When the types have been locked up by screws on the turtle, they can be placed on the machine for printing without risk of falling out, or they can be molded in thin curved form by the papier-mâché process, and the curved plate made therefrom can be used in printing. The stereotype method is preferred.—**Bastard turtle**, *Thalassochelys kempi*.—**Box-turtle**. See *box-tortoise*, *Cistudo*, *coati*, *r*, *Paris*.—**Chicken-turtle**. Same as *chicken-tortoise*. into Europe from China and the East Indies, and formerly, especially in the second half of the eighteenth century, an article of considerable commercial importance—this metal having been purchased by the Dutch in China and by them distributed through the East Indies and supplied to India proper, whence more or less of it found its way to Europe, where its manufacture seems to have been begun on a small scale, both in Germany and in England, about 1730. It is said that the name *tutenag* was first given to an alloy imported from the East by the Portuguese, and that this alloy was the gong-metal of the Chinese, which is a variety of bronze. This would seem to be probable, since the first mention of this alloy, so far as known, is that of Libavius, who, in his work "De Natura Metallorum," published in 1597, describes a white bronze (*res alba*), which he says is not zinc, but a peculiar kind of tin brought from the East Indies, and which is sonorous, for which reason it was called by the Spaniards *tintinasso*, from *tintinnare*, 'to resound.' Whether this name was a variant of *tutenag* (also spelled in a great variety of other ways, among which *tintinague*) or an independent designation of the alloy is not known. The whole matter of the early nomenclature of zinc is extremely obscure. See *zinc*.

2. In *law*, the guardian of a boy or girl in pupilarity. A *tutor nominate* is one nominated in a testament, etc., by the father of the child or children to be placed under guardianship. A father may nominate any number of tutors. A *tutor-at-law* is one who acquires his right by the mere disposition of law, in cases where there is no tutor nominate, or where the tutor nominate is dead, or cannot act, or has not accepted. A *tutor dativus* is one named by the sovereign on the failure of both tutors nominate and tutors-at-law. In civil law it was originally considered as a right of the nearest relative to be named the tutor in order to preserve the fortune for the family, and it was only gradually that the protection of the infant himself came to be considered the principal object, and the filling of the office of tutor more as a duty which had to be fulfilled unless there were special circumstances to excuse, than as a right which a relative could claim.

3. A compound crystal one part of which is in a reversed position with reference to the other. As if it had been revolved through 180°.

When it had been revolved through  $180^\circ$  about its axis (twinning-axis) perpendicular to a plane which is called the *twinning-plane*, and is usually a fundamental plane of the given crystal. the twinned octahedron of fig. 2 results, the twinning-plane being here a face of the octahedron; such twins are common with spinel, and are hence called *spinel twins*. This is also called a *juxtaposition- or contact-twin*, in distinction from a *penetration-twin*, such as is represented in fig. 3, where each crystal is complete and self-

trates the other. If the molecular reversal is often repeated in the growth of a crystal, a *poly-synthetic twin* may result, consisting of successive thin layers or lamellæ of two sets, alternately in-

between the axes of the two parts of the twin crystal is an aliquot part of  $360^\circ$ , repeated twinning may occur (thus,  $3 \times 120^\circ$ ,  $4 \times 90^\circ$ ,  $5 \times 72^\circ$ , etc., complete the form); the resulting compound crystal may then imitate (mimetic form) a form of higher symmetry than belongs to the single crystal, and hence be a case of pseudosymmetry: for example, the twin crystals of  $\text{CaSO}_4$  which are identical in

For example, the twins of aragonite (which has a prismatic angle not far from 120°) have often the form of a pseudohexagonal crystal; the six-rayed stellate twins of cerussite give another common example of a repeated twin. In some cases the imitation is so perfect that the true nature of the form can be determined only by an investigation in polarized light. — **Albite twin.** A kind of twin

common with albite and the other triclinic feldspars, where the twinning-plane is the brachydiagonal plane of the crystal and the twinning gives a characteristic

the basal plane or surface of most perfect cleavage: such twins are usually polysynthetic, and give rise to a series of fine lines seen on the basal cleavage-face. — **Baveno twin**, a kind of twin crystal of orthoclase feldspar, first noted in crystals from Baveno in Italy. The twinning plane is a clinodome inclined about 45° to the base, and the twin has nearly the form of a square prism. — **Carlsbad twin**, a name given to the common twin crystals of orthoclase feldspar often observed in granites, trachytes, and other crystalline rocks, as at Carlsbad in Bohemia. The twinning-axis is here the vertical crystallographic axis, and the twins are commonly of the penetration type. — **In twin**, a twin, in two, apart.

*Destruction of Troy* (E. E. T. S.), i. 118-1.

**Paragenetic twin**, an ordinary twin crystal in which the compound structure may be considered to belong to it from the beginning of its formation: sometimes used in distinction from *metagenetic twin*, where the molecular reversal seems to have begun after the crystal had reached a certain development; the latter kind is illustrated by the geniculated twins of rutile. — **Parasitic twin**, in *teratol*. See *autolite*. — **Pericline twin**, a twin common with the variety of albite called pericline, also with the other triclinic feldspars, where the twinning-axis is the macrodiagonal axis. Such twins are often polysynthetic, and then give a series of striations on the brachy-diagonal plane or surface of second cleavage; the direction of these striations varies with the composition of the feldspar according to a definite law. — **Spinel twin**. See above, under def. 3. — **The Siamese twins**. See *Siamese*. — **The Twins**, a constellation and sign of the zodiac: Gemini.

2. The phenomenon of scintillation of the fixed stars, consisting of fluctuations of light and of color at the rate of from fifty to a hundred per

second. The fluctuations of light did not escape the notice of the ancients; those of color were noticed by Robert Hooke in 1665. The phenomenon was, without any reason

son at all, generally supposed to have its origin in the eye, until William Nicholson, the chemist, showed in 1813 that, if the image of a twinkling star was stretched out into a ribbon by an irregular movement of the tele-

cope, the fluctuations would appear as variations of light and color along this ribbon. Charles Dufour, in 1856, published the following generalizations of his observations, now known as *Dufour's laws*: (1) the pale stars twinkle

more than the chrome, and the chrome more than theuddy ones; (2) at different altitudes the twinkling is proportional to the coefficient of astronomical refraction multiplied by the trajectory of the ray; and (3) the twinkling

diminishes as the diameter of the star increases. Lorenzo Respighi, in 1863, examined the effect of twinkling upon the spectra of stars. He found that oblique bands of haze pass over the spectrum in different directions

Finally, Charles Montigny, with a special instrument called scintillometer, has made extensive observations concerning the differences of the rate of twinkling at different

asons, under different meteorological conditions, and  
or different stars. It is certain that twinkling is due in  
ome way to the entrance and passage of the light in the  
tmosphere, but how is not altogether settled. Twinkling

externus by the tympanic membrane, communicating  
with the back of the mouth by the Eustachian tube, in  
relation with the labyrinth, or inner ear, its inner wall  
forming part of the wall of the latter, and containing the  
chain of little bones called ossicula auditus, and usually  
the chorda tympani nerve. It is a part of the passage-  
way which in the early embryo is uninterrupted between  
the pharynx and the exterior, and in the adult is occluded  
only by the membrane of the tympanum. In the dry  
state of the parts, the bony walls of the human tympa-  
num present several openings: that leading outward  
through the external auditory meatus; the orifice of the  
Eustachian tube; the openings of mastoid cells; the fe-  
nestra ovalis and fenestra rotunda, respectively the ter-  
minations of the scala vestibuli and scala tympani, com-  
municating with the vestibule and cochlea of the inner  
ear; the iter posterius, by which the chorda tympani  
nerve enters the tympanum from the aqueduct of Fallo-  
pius; the iter anterior, by which the same nerve leaves  
the tympanum by the canal of Huguier; the canal for  
the tensor tympani muscle; the Glaserian fissure, between  
the squamosal and the tympanic bones, for the laxator  
tympani muscle, tympanic artery, and slender process of  
the malleus, these last two openings being rifts between  
component bones of the parts communicating, like the  
Eustachian tube, with parts outside the temporal bone;  
and the minute orifice at the apex of the pyramid, for  
the passage of the stapedius muscle. In animals below  
mammals, as birds and reptiles, the tympanum contains  
the columella, when that bone exists, and is the cavity of  
the external ear when there is no external auditory me-  
atus. Its membrane is often upon the surface of the head,  
and in some cases is a conspicuous structure of the ex-  
terior, as in a frog or toad. This is well shown in the  
cut under *parotoid*, where the circular formation just  
in front of the parotoid is the tympanum. See also cuts  
under *ear* and *temporal*. (b) The tympanic mem-  
brane; the ear-drum, in the restricted sense  
of that term: so used in physiology and aural  
surgery, and in common speech: as, a rup-  
ture of the *tympanum*. See *tympanic mem-  
brane*, under *tympanic*. (c) In *ornith.*: (1) The  
labyrinth at the bottom of the windpipe of  
sundry birds, as the mergansers and various  
sea-ducks: a large irregular bony or gristly  
dilatation of the lower part of the trachea,  
often involving also more or less of the up-  
per ends of the bronchi. It is chiefly found,  
or most developed, in the male sex. (2) The  
naked inflatable air-sac on each side of the  
neck of certain birds, as grouse, especially  
the sage-grouse and prairie-hen, in which the  
ordinary cervical air-cells of birds are inor-  
dinately developed and susceptible of great  
distention. See cut under *Cupidonia*. (d) In  
*entom.*, a tympanic membrane, stretched upon  
a chitinated ring, one surface being directed to  
the exterior, the other to the interior, in rela-  
tion with a tracheal vesicle and with nervous  
ganglia and nervous end-organs in the form of

clavate rods, as in the *Orthoptera*, where such an arrangement constitutes an auditory organ. —3. In arch.: (a) The triangular space forming the field or back of a pediment, and included between the cornices of the inclined sides and

the horizontal cornice; also, any space similarly marked off or bounded, as above a window, or between the lintel of a door and an arch above it. The tympanum often constitutes a field for sculpture in relief or in the round. See also cuts under *pediment* and *pedimented*.

The triforium openings consist of a pointed arch in each bay, spanning a sub order of two pointed arches. . . . The tympanum is pierced with a trifol.

—4. (a) In *hydraul. engin.*, a water-raising current-wheel, originally made in the form of a drum, whence the name. It is now a circular open-frame wheel, fitted with radial partitions so curved as to point upward on the rising side of the wheel and downward on the descending side. The wheel is suspended so

that its lower edge is just submerged, and is turned by the current (or by other power), the partitions scooping up a quantity of water which, as the wheel revolves, runs back to the axis of the wheel, where it is discharged; or it may discharge at some point of the periphery. While one of the most ancient forms of water-lifting machines, it is still used in drainage works, though for small lifts it is now superseded by the *scoop-wheel*. E. H. Knight.

(b) A kind of hollow tread-wheel wherein two or more persons walk in order to turn it, and thus give motion to a machine.—5. In bot., a membranous substance stretched across the theca of a moss.—Laxator tympani. See *laxator*.

2. Something that has a representative or symbolical significance; an emblem, or an emblematic instance.

Some of our readers may have seen in India a cloud of crows pecking a sick vulture to death—no bad type of what happens in that country as often as fortune deserts one who has been great and dreaded.

Macaulay, Warren Hastings.

3. Specifically, a prefigurement; a foreshadowing of, or that which foreshows, some reality to come, which is called the *antitype*; particularly, in *theol.*, a person, thing, or event in the Old Testament regarded as foreshowing or betokening a corresponding reality of the new dispensation; a prophetic similitude: as, the paschal lamb is the type of Christ (who is the *antitype*).

5. A representative style, mode, or structure; a characteristic assemblage of particulars or qualities.—6. In *biol.*, specifically, a main division of the animal or vegetable kingdom; a sub-kingdom, branch, phylum, or province. Thus, Leuckart divided animals into the six types *Coelenterata*, *Echinodermata*, *Vermes*, *Arthropoda*, *Mollusca*, and *Vertebrata* (the protozoans not being treated). The vegetable kingdom is similarly divided into main groups called *types* of vegetation; and in general, in any department of biology, *type* is predicable of the structure or morphological character of a division or group of any grade in taxonomy, down to the species itself, as compared with another group of its own grade: as, a family type, a generic type. (See *type genus*, *type species*, *type specimen*, and *unity of type*, below.) The term has both a concrete or material sense, in its application to actually embodied form, and an ideal sense, as applied to form in the abstract. See *archetype*, *prototype*, *autotype*.

Natural Groups are best described, not by any definition which marks their boundaries, but by a *Type* which marks their centre. The *Type* of any natural group is an example which possesses in a marked degree all the leading characters of the class.

Whewell, Philos. of Inductive Sciences, I. p. xxxii.

The whole animal kingdom can be broken up into several large divisions, each of which differs from the rest by a number of special characteristics. The essential character may be recognized in all the subdivisions, and even under great individual variations. This has been called the *type*. Gegenbaur, Comp. Anat. (trans.), p. 64.

7. A right-angled prism-shaped piece of metal or wood, having for its face a letter or character (usually in high relief), adapted for use in letterpress printing; collectively, the assemblage of the stamped characters used for printing; types in the aggregate. Types of wood are of large size, and are now used only for posting-bills. Types for books or newspapers are of founded metal. (See *type-metal*, *matrix*, and *mold*⁴.) of type is .9166 inch; in the United States it is variable, from .9166 to .9186 inch. French and German types are higher. The features of type are face, counter stem (thick stroke, or body-mark), hair-line, serif, neck or beard, shoulder, body or shank, pin-mark, nick, feet, groove, (See cut below.) The names of printing-types, given in an increasing scale as to size, are *ex-celsior*, *brilliant*, *diamond*, *pearl*, *agate* or *ruby*, *nonpareil* (the type in which this is printed), *emerald* or *minionette*, *minion*, *brevier* (the larger size of type used throughout this dictionary), *bourgeois*, *long primer*, *small pica*, *pica*, *English*, *two-line brevier*, *great primer*, *paragon*, *double small pica*, *double pica*, *double English*, *double great primer*, *meridian* or *tracafalgar*, and *canon*. All sizes larger than canon are named by the regular multiples of pica, as *five-line pica*, *six-line pica*. The smaller sizes are or should be graded so that each size will be doubled in its seventh progression. (See *point*¹, 14 (b).) The names here given define the dimensions of the bodies only. The faces or styles of types most used are roman and italic, which form the text of all books in English. Antique, gothic, clarendon, and black-letter are approved styles for display. The type for headings of entries in this dictionary and for phrase-headings is antique condensed. Ornamental types are too irregular for classification. Of each style many varieties are made, which are usually labeled with a special name. Roman types are broadly divided into two classes, *modern* and *old-style*. The leading forms of modern roman are broad-face, Scotch-face, French-face, thin-face, bold-face. Old-style types are reproductions of the styles of early printers: the Caslon and the Baskerville (English styles), of the eighteenth century; the French and the Elzevir, of the seventeenth century; and the Basle, or early Italian, of the sixteenth

**type-measure** (tip'mezh'ūr), *n.* Same as *type-scale*.

**type-measurer** (tip'mezh'ūr-ēr), *n.* In *printing*, a graduated rod on the sides or edges of which the body of each different size of type is marked. In use it is laid alongside a column of matter or proof, to ascertain the number of lines and the number of ems.

**type-metal** (tip'met'al), *n.* An alloy of lead with antimony, or with tin and antimony, used to make types for printing. The value of the alloy is considerably increased by the addition of a small amount of tin (from 6 to 8 per cent.). Copper and iron have also been used in small quantity to give greater resistance to the alloy. The proportions of the metals used vary considerably with the quality desired, and in different type-foundries. The metal used in some foundries for small types, from brilliant to brevier, consists of 100 pounds of lead, 40 pounds of antimony, and 20 pounds of tin; while larger types, from bourgeois to pica, are cast from 100 pounds of lead, 30 pounds of antimony, and 15 pounds of tin. Extra hard or copper-alloy metal contains 100 pounds of lead, 44 pounds of antimony, 24 pounds of tin, and 6 per cent. of copper. Electrotype-metal contains 100 pounds of lead, 4 pounds of antimony, and 5 pounds of tin. Stereotype-metal contains 100 pounds of lead, 20 pounds of antimony, and 10 pounds of tin. Soft metal, such as is used for leads and quadrats, contains a very large proportion of lead, and but little tin and antimony.

**type-mold** (tip'möld), *n.* See *mold*, 3.

**type-punch** (tip'punch), *n.* See *punch*, 6.

**type-scale** (tip'skāl), *n.* A measuring-rod of stout paper, ivory, or thin brass, which shows the dimensions of the most-used bodies of type. It is used to measure composed types.

**type-setter** (tip'set'er), *n.* 1. A composer of types; a compositor.—2. A type-setting machine. See *type-setting*.

**type-setting** (tip'set'ing), *n.* The act or process of setting or combining types in proper order for printing. It is usually done by picking up each type from an exposed case, and arranging the types so collected in a composing-stick in lines of even length.—**Type-setting machine**, a mechanism intended to quicken the operation of type-setting. In the simpler forms of mechanical type-setters, the types, separately arranged in inclined tubes or channels, are successively dislodged by the pressure of appropriate levers moved by the fingers of the operator on a keyboard. As the types fall, they are collected in a long line, and afterward subdivided in lines of proper length. The Kastenbein and McMillen machines are of this construction. Distribution of types is usually done by a separate machine, of which there are many varieties. In all, each distinct letter or character is provided with its own special nick, which serves the

same purpose as the nicks or channels in a key for the wards of its lock. When the types are successively presented before outlets with wards, the proper nick finds its proper ward, and is discharged in its proper channel. Some machines combine the two operations of setting and distribution, as the Thorne and Paige machines. The Paige machine adds the operation of automatic justifying, or making its lines of even length. A more complex form of machine dispenses with types and distribution, and makes the types as they are needed. The operator at the keyboard moves levers that assemble the matrices in proper order over a mold, and justifies the words of each line, in a line evenly spaced and of uniform length. The mold is then instantly filled with melted type-metal, which casts all the words in one piece. The Mergenthaler, or linotype, and the Rogers are of this form. The Lan-

ston casts single types by the pressure of the finger on a keyboard, and arranges the cast types in lines for printing. The first type-setting and type-making machine was planned at London by Dr. Church in 1824. More than fifty varieties of machine type-setters have been invented, but few are in use.

**type-wheel** (tip'hwēl), *n.* A disk or revolving sector bearing letters in relief on its periphery: used in some adaptations of the telegraph and in some type-writers.

**type-write** (tip'rit), *v. t. and i.* To print or reproduce by means of a type-writer; practise type-writing. [Recent.]

**type-writer** (tip'rit-ēr), *n.* 1. A machine for mechanical writing, operated by hand, and printing one letter, or combination of letters, at a time, by the impress of type adapted to the purpose. There are now several distinct types of these machines.—2. An operator on a type-writing machine; one who prints characters on paper by means of a type-writer.—**Automatic type-writer telegraph**. See *telegraph*.

**type-writing** (tip'rit'ing), *n.* The process of printing letter by letter by the use of a type-writer; also, work done by this process.

**Typha** (ti'fä), *n.* [NL. (Tournefort, 1700; earlier by Lobel, 1576), < Gr. *τύφη*, cattail.] A genus of plants, type of the order *Typhaceæ*. It is distinguished from *Sparanium*, the other genus of the family, by its linear anthers, stalked ovary, and dry indehiscent fruit. There are 13 species, natives of fresh-water swamps in both tropical and temperate regions. They are smooth herbs with strong creeping rootstocks from which grow erect unbranched and often tall and robust stems with a submerged base. The leaves are chiefly radical, long and linear, spongy, and at first somewhat fleshy and watery. The monococious flowers form a cylindrical terminal spadix, the upper part of which is staminate and deciduous; both parts are partly covered in the bud by very perishable thin spatheaceous bracts. The long-stalked minute fruit is produced in great abundance, over 60,000 to the average spike in the common species; each fruit contains a single seed, and is surrounded near the base by twenty to forty long slender white hairs which expand at maturity, aiding in dispersion by the wind. The plant usually reaches from 5 to 9 feet high; in California *T. domingensis* sometimes reaches 18 feet, including an inflorescence of 3 feet; in the common *T. latifolia* the handsome dark rusty-brown fertile part of the spike is usually from 5 to 8 inches long, sometimes 14, and is much used for rustic decoration. The abundant mealy pollen is made into bread in India and New Zealand; it is inflammable, and has been used as a substitute for tinder and for matches. The powdered flowers have been used for poultices, and the farinaceous rootstocks are considered astringent and diuretic in eastern Asia. The long leaves are much used in central New York to make chair-bottoms, and are elsewhere woven into mats and baskets. Three species occur in the United States, of which *T. latifolia*, with four-grained pollen, and *T. angustifolia*, with single-grained pollen, are widely distributed throughout the northern parts of both hemispheres; the latter is in the United States more local and largely maritime, and often shows a distinct interval between the male and female divisions of the spike. The other and larger species, *T. domingensis*, occurs in the West Indies, Mexico, Texas, California, and the Argentine Republic. For *T. elephantina*, see *elephant-grass*; for the others, *cattail*, *reed-mace*, and *verree*; and compare *marsh-beetle* and *dunche-down*. They are also commonly known as *flag* and as *buttrush*.

**Typhaceæ** (ti-fä'sē-ē), *n. pl.* [NL. (A. P. de Candolle, 1805), < *Typha* + *-aceæ*.] An order of monocotyledonous plants, of the series *Nudifloræ*. It is characterized by usually monococious flowers with a perianth of irregular membranous scales or of very slender elongated hairs. It includes about 19 species, belonging to 2 genera, *Typha* (the type) and *Sparanium* (where see cut), both marsh-plants of wide distribution, with unjointed watery stems and long entire alternate leaves which project stiffly out of the water or in a few cases float on its surface. The small crowded flowers contain six or more stamens with elongated flaccid filaments, and a single superior ovary usually with a single cell and a single ovule.

**typh-fever** (tif'fē-vēr), *n.* [*typh(us)*, *typh(oid)*, + *fever*.] A term proposed to include both typhus and typhoid fevers.

**typhina** (ti-fī'nī-ä), *n.* [NL., < Gr. *τύφος*, smoke, mist: see *typhus*.] In *pathol.*, relapsing fever. [Rare.]

**typhlophthalmic** (tif-lōf-thal'mik), *a.* [*typhlophthalmi* + *-ic*.] Of or pertaining to the *Typhlophthalmi*.

**Typhlopidae** (tif-lōp'i-dē), *n. pl.* [NL., < *typhlops* + *-idae*.] A family of anguiostomatous scolecophidian serpents, typified by the genus *Typhlops*; the worm-snakes or blindworms. It formerly included all the small serpents with the mouth not distensible and teeth only in one jaw, upper or lower, being the same as *Typhlopidae*. By the division of these into two families, *Catadonta* and *Epanodonta*, with lower and with upper teeth only, respectively, the *Typhlopidae* are restricted to the latter, and contrasted with *Stenostomidae*.

**Typhlopoidea** (tif-lō-poi'dē-ä), *n. pl.* [NL., < Gr. *τύφλος*, blind, + *ὤψ*, eye, + *-είδος*, form.] A suborder of *Ophidia*, containing the small scolecophidian or anguiostomatous snakes of the families *Typhlopidae* and *Stenostomatidae*, and thus equivalent to *Typhlopidae* in a broad sense. They differ from all other ophidians in having no transverse bone of the skull, the pterygoid disconnected from the quadrate, the palatines with their long axes transverse and bounding the nasal choanae behind, and the ethmoidal forming part of the roof of the mouth.

**Typhlops** (tif'lōps), *n.* [NL. (Schneider), < Gr. *τύφλος*, blind, + *ὤψ*, eye.] The typical genus of *Typhlopidae*, having the muzzle covered above with rostral and internasal scutes, and one ocular, one preocular, and one nasal plate.

**typhlosis** (tif-lō'sis), *n.* [NL., < Gr. *τύφλωσις*, a making blind, blindness, < *τύφλω*, make blind, < *τύφλος*, blind.] Blindness.

**typhlosolar** (tif-lō-sō'lār), *a.* [*typhlosolar* + *-ar*.] Of the character of or pertaining to a typhlosolar. *Microsc. Sci.*, N. S., XXVII, 565.

Invert.*, p. 196.

**Typhoëan** (ti-fō'ē-an), *a.* [Also, erroneously, *Typhæan*, *Typhæan*; < L. *Typhæus*, < Gr. *Τυφῆος*, contr. *Τυφός*, Typhoëus (see *def.*); cf. *Typhon*.] Of, pertaining to, or resembling Typhoëus (or Typhos), a monster of Greek mythology, who tried to conquer the gods, but was overcome by Zeus and buried under Mount Etna. Typhoëus is described as vomiting flame from a hundred mouths, and thus typifies a volcano.

same purpose as the nicks or channels in a key for the wards of its lock. When the types are successively presented before outlets with wards, the proper nick finds its proper ward, and is discharged in its proper channel. Some machines combine the two operations of setting and distribution, as the Thorne and Paige machines. The Paige machine adds the operation of automatic justifying, or making its lines of even length. A more complex form of machine dispenses with types and distribution, and makes the types as they are needed. The operator at the keyboard moves levers that assemble the matrices in proper order over a mold, and justifies the words of each line, in a line evenly spaced and of uniform length. The mold is then instantly filled with melted type-metal, which casts all the words in one piece. The Mergenthaler, or linotype, and the Rogers are of this form. The Lan-

**Tyrannidæ** (ti-ran'i-dē), *n. pl.* [NL., < *Tyrannus* + -idæ.] A family of passerine birds, named from the genus *Tyrannus*; the tyrant-birds or tyrant-flycatchers. There are many genera, and upward of 400 species, confined to America, and chiefly represented in the Neotropical region. They are readily distinguished by the non-oscine (clamatorial or mesomyodan) character of the syrinx, the scutellipalmar tarsi of the exapidae type, ten primaries of which the first is not spurious, twelve rectrices, and the bill almost invariably hooked at the end by an overhanging point of the upper mandible. The rictus as a rule is strongly bristled; the hind toe is eleutherodactylous, or freely movable apart from the others (as in oscine *Passeres*), and the outer and middle toes are united only at their bases. It is one of the most extensive and characteristic groups of its grade in the New World, only the *Tanagridæ* and *Trochilidæ* approaching it in these respects. Its relationships are with the other non-oscine *Passeres* highly developed in and peculiar to the Neotropical region, namely the *Pipridæ* and *Cotingidæ*; but not with the true flycatchers, or *Muscicapidæ*, to which many of the long-known species used to be referred. Only 8 or 9 genera extend into the United States, and of these only 5 (*Tyrannus*, *Myiarchus*, *Sayornis*, *Contopus*, and *Empidonax*) have any extensive distribution in that country. The genus *Oxyrhynchus*, without any hook of the beak, is often now separated as the type of another family, aside from this the *Tyrannidæ* are by Slater divided into 4 subfamilies—*Teniotpterinæ*, *Platyrhynchinæ*, *Elanidæ*, and *Tyranninæ*. See cuts under *Contopus*, *Empidonax*, *Fluicicola*, *King-bird*, *Megarhynchus*, *Milvulus*, *perit*, *Platyrhynchus*, *Pyrocephalus*, *Sayornis*, *scissortail*, *Teniotptera*, *Todirostrum*, and *Tyrannulus*.

**Tyranninæ** (ti-ran'ni-nē), *n. pl.* [NL., < *Tyrannus* + -inæ.] A subfamily of *Tyrannidæ*, containing the true tyrant-flycatchers, of arboreal habits, and usually more or less extensively olivaceous coloration, sometimes gray, varied chiefly with white or yellow, and often with a bright-colored spot on the crown. Birds of this group abound throughout the woodlands of America, from the limit of trees both north and south, and play an important part in the economy of nature, comparable to that of the true flycatchers (*Muscicapidæ*) of the Old World. In the United States the scissortail (*Milvulus forficatus*), the common kingbird or bee-martin (*Tyrannus carolinensis*), the great crested flycatcher (*Myiarchus cinerascens*), the wood-pewee or sayornis (or *Empidonax fuscus*), the wood-pewee or phoebe-bird (*Contopus virens*), and several smaller flycatchers of the genus *Empidonax* furnish characteristic examples of the *Tyranninæ*. There are in all about 20 genera.

**Tyrannus** (ti-ran'us), *n.* [NL. (Cuvier, 1800), < L. *tyrannus*, tyrant: see *tyrant*.] The name-giving genus of *Tyrannidæ*, formerly loosely extended to embrace most of the larger species then known (so named from their irritable or irascible disposition and their tendency to tyrannize over other birds), now restricted to a few large stout flycatchers like the common king-bird or bee-martin of the United States, *T. tyrannus*, *T. pipiri*, *T. intrepidus*, or *T. carolinensis*. They have the head with a vertical crest, the bill stout, hooked, and well-bristled, several outer primaries emarginate, the tail even or emarginate, and the coloration black and white, or gray and white, or olive and yellow. The gray king-bird of the West Indies and southern United States (*T. dominicensis* or *T. griseus*), the Arkansas flycatcher (*T. verticalis*) of the Western States and Territories, Cassin's and Couch's flycatchers of the Southwestern States and southward (*T. vociferans* and *T. melancholicus*), are additional examples; and others occur in the West Indies and Central and South America. 77614. *Asplenium* sp. 12. 1. 1911.

1. The twenty-first character and fifth vowel-sign in the English alphabet. The Phœnician alphabet, from which ours comes ultimately (see under *A*), had no such sign, but ended with *T*. A sign for the *u*-sound (that is, for *oo*, or *o*, as it is represented in the respellings of this dictionary) was added by the Greeks when they adapted the

Phœnician signs to their own use, and was written differently *U* or *V*; but the latter finally established itself as the accepted form in Greek usage, while the former became customary in the derived Italian alphabets; so that, considerably later, the Romans were able to import *V* as a separate and foreign character, to represent the foreign Greek sound *ū* (= French *u*, German *ü* or *ue*), into which the Greek *ō* had meanwhile become to a great extent altered in pronunciation. The *V* was also commonly written with its angle rounded, as *U*; and *V* and *U* were for a long time merely different forms of the same sign (like *I* and *J*); it is only recently that they have come to be always distinctly held apart, and have different values given them. As *W* also is a doubled *U* or *V*, it appears that our four letters *U*, *V*, *W*, and *Y* all come from a single sign added by the Greeks at the end of the Phœnician system. The sound originally and properly represented by the character, and still belonging to it in most languages outside of English, is the *oo* or *ō* sound, as in *mood*, *move*, *rule*, and the like, the closest of the labial vowels, or rounded vowels, as they are often called (see under *O*); but this value the letter has in English only in exceptional cases. What we call "long *u*," namely, is this same sound with the semivowel *y* prefixed, as *yoo* (*yō*); and what we call "short *u*" is the more open of the two shades of neutral vowel-sound. The digraphs *ue*, *eu*, and *ew* also have, as long, the *yō*-value in the same manner and degree. The *y*-element in the sound, namely, is not always alike full and undeniable, but varies somewhat, according to the difficulty of slipping it in after a preceding consonant. After a guttural (*k*, *g*) or a labial (*p*, *b*, *m*, *f*, *v*), as when initial, the utterance is completely *yō*; but after the tongue-tip letters (*t*, *d*, *n*, *th*, *s*, *z*, *l*, *r*) the insertion of *y* involves a more difficult combination of movements of the tongue, and the element is apt to be slighted, being reduced rather to a bit of *i*; and in the practice of many speakers, and in certain localities, it is even omitted altogether, so that the *yō* becomes simple *ō*, *new* being pronounced *noo*, *lucid* *lorid*, and so on. The difficulty in the way of inserting the *y*, however, is removed if the preceding syllable has the accent; and hence even those who pronounce *peno rious* say *pen'ary*, and so in all other like cases. This omission of the *y*-element is not approved, but is stigmatized as provincial or vulgar, although practised by many educated and careful speakers, and probably becoming more prevalent. It is more generally condoned, and even accepted, after *l* than after *t*, *d*, *n*, etc., and some standard authorities in England itself now pronounce and teach *lo* instead of *lū*; in this dictionary the *u* is so marked if it occurs after *l* preceded by another consonant, as in *fluid* (*flō'id*). After *r*, the difficulty of adding the *y*-sound before a vowel is greater than after any other tongue-tip consonant; hence in this situation the pronunciation of "long *u*" as *ō* is almost universally accepted and practised. Further, after *t*, *d*, *s*, *z*, "long *u*" becomes *ō* when the *y*-element is as it were absorbed into *ch*, *j*, *sh*, and *zh*; nor is the *y*-element heard when *u* follows any of these sounds having an independent origin, as in *jury*, etc. The real short *u*-sound, or that corresponding to *ō* as long, is in a limited number of words also represented by *u*, as in *bull*, *put*, etc.; also by double *o*, as in *look*, *foot*, etc. What we call "short *u*" is in the great majority of cases written with *u*, but also with *o*, as in *son*, with *oo*, as in *blood*, and with *ou*, as in *young*, and in the slighted pronunciation of unaccented syllables with almost any vowel. Cases like *bury* and *busy* and *buy* are anomalous and isolated. A *u* is always written after *g*, and this *u* (save in the exceptional cases in which it is silent) has a consonantal value, being pronounced as the semivowel *w*; and it is so treated sometimes also after other consonants, especially *s*, as in *suave*, *persuade*, *anguish*. *U* is silent in many words after *g*, having only (as in French) the office of preserving the hard sound of the *g*; thus, *guide*, *plague*. Like *i* and *y*, *u* is never doubled.

Ubiety is generally said to be either repletive, circumscriptive, or definitive; but these terms are taken in different senses by different authors. According to the best usage, repletive ubiety is that of a body which excludes other bodies from its place by its absolute impenetrability; circumscriptive ubiety is that of any extended image which is in a place part by part without excluding other objects; definitive ubiety is connection with a portion of space, all in every part, and not part by part.

The name of *Ubiquitarians* is commonly given to those among the Lutherans who held the doctrine of the ubiquity of the real presence of his body in the eucharist. Their opponents regarded this view as denying a special sacramental presence and as confounding the two natures of Christ. For the latter reason the name is sometimes given to the Monophysites. B. Jonson, *Love's Welcome at Welbeck*.

Ubiquity of the king, in law. See the quotation.

A consequence of this prerogative is the legal ubiquity of the king. His majesty, in the eye of the law, is always present in all his courts, though he cannot personally distribute justice. His judges are the mirrors by which the king's image is reflected. It is the regal office, and not the royal person, that is always present in court, always ready to undertake prosecutions, or pronounce judgment, for the benefit and protection of the subject. And from this ubiquity it follows that the king can never be nonsuited; for a nonsuit is the desertion of a suit or action by the non-appearance of the plaintiff in court. For the same reason, also, in the forms of legal proceedings, the king is not said to appear by his attorney, as other men do; for in contemplation of law he is always present in court.

Blackstone, *Com.*, i. vii.

**ukase** (ū-kās'), *n.* [= *F. ukase, oukase* = *Sp. ukase* = *Pg. ukase* = *G. ukas*, < *Russ. ukaz*, an ordinance, edict; cf. *ukazivati*, *ykazati*, show, indicate, order, prescribe, < *y- + kazati*, show.] 1. An edict or order, legislative or administrative, emanating from the Russian government. Ukases have the force of laws till they are annulled by subsequent decisions. A collection of the ukases issued at different periods, made by order of the emperor Nicholas, and supplemented since year by year, constitutes the legal code of the Russian empire.

In former times, cruel punishments with whips used to be obtained in episcopal circulars as well as in Imperial ukases. A. J. C. Hare, Russia, I.

Hence—2. Any official proclamation.

Lord Canning is probably not nearly as enthusiastic with respect to the effect of the Proclamation as he was last March, when he issued his famous *ukase* to the landlords of Oude. W. H. Russell, Diary in India, II. 280.

**ulcer** (ul'sér), *n.* [= *F. ulcère* = *Sp. Pg. ulcera* = *It. ulcera, ulcere, ulcero*, < *L. ulcus* (ulcer-), also *hulcus* (hulcer-), a sore, ulcer, = *Gr. ἔλκος*, a wound, sore, ulcer.] 1. A sore in any of the soft parts of the body, open either to the surface or to some natural cavity, and attended with a secretion of pus or some kind of discharge; a solution of continuity of the skin of the body, or of the investing tissue of any natural cavity, the result of morbid action, not of mechanical injury nor of a healthy reparative process. A wound may become an ulcer, but is not such unless diseased action is set up. An abscess is an ulceration within the tissue of a part which has formed a morbid excavation with a contracted orifice or none. Ulcers have been divided into *local* and *constitutional*, but the distinction is not obvious. They are also treated as *simple* or *specific* sores. Most ulcers are both constitutional and specific—that is, the local exhibition of a specific poison which infects the whole system, as the diphtheritic, the syphilitic, or the carcinomatous; others are less obviously specific, as the scrofulous or the scorbutic.

2. Hence, figuratively, a sore, blot, stain, or cause of reproach, in an ethical sense: as, an ulcer of the body politic.

To feed the living ulcer of a corroding memory.

Burke, Rev. in France.

**Aden or Aleppo ulcer**, a cutaneous affection occurring in the East, which, beginning as a small red papule, grows, suppurates, and finally ulcerates. They bear alternate serrate two-ranked feather-veined leaves on slender and often recurving branches which form a graceful flat spray. The flower-clusters contain numerous small apetalous flowers, almost all perfect or mainly staminate, in 4 North American species preceding the leaves, and followed by disk-like notched and veiny samaras, which fall as the leaves expand. (See cut under *samaras*.) Several other species are evergreen and late-flowering, as *U. parvifolia* of China and Japan. Five species occur in the United States (for which see *elm*, *slippery-elm*, *rock-elm*, and *wahoo*). Three species occur in Europe, all of them extending into Asia—*U. campestris*, the common Old World elm (see cut under *elm*), parent of very numerous cultivated varieties; *U. effusa* (*U. pedunculata*), the water-elm of central Europe; and *U. montana*, the wych-elm, the only one thought to be native to Great Britain. *U. Americana*, *U. effusa*, and also *U. Wallichiana*, the Hima-layan elm, sometimes reach a very large size, from 100 to 150 feet high, and 7 to 8 feet in diameter. *U. pumila*, the dwarf elm of Siberia, a very low shrub, forms the other extreme of the genus. *U. effusa*, the common village elm of Prussia, is peculiar in forming sharp ribs about its base in old age, which serve as natural buttresses.

**ultramarine** (ul'trā-mā-rēn'), *n. and a.* [= *Sp. Pg. ultramarino, < L. ultra, beyond, + marinus, marine.*] **I.** *n.* **1.** A beautiful natural blue pigment, obtained from the mineral lapis lazuli, a variety of haüyne. This stone occurs in Siberia, Persia, Tibet, and some other localities. (*See lapis lazuli, under lapis.*) Small golden specks of iron pyrites are usually scattered through it. To prepare the pigment, selected pieces are heated and cooled in water, producing disintegration. The powder is then purified by repeated washings, the several wash-waters depositing pigments of different depths of color, the gray powder known as *ultramarine ash* being the last and least valuable product. *Ultramarine* is very permanent under all conditions, and is, in color, the purest blue available. Its use is limited, however, by its great cost, and also by the fact that artificial *ultramarine* is practically as valuable. The color of both natural and artificial *ultramarine* is a rather dark and intensely chromatic violet blue. The natural *ultramarine* is only slightly violet, the artificial is very much so. Also called *lazuuli-blue*.

**2.** Azure-stone.—**Artificial ultramarine**, the common *ultramarine* of commerce, prepared by grinding together a mixture of clay, carbonate of soda, sulphur, and rosin: discovered about 1330 by the chemist Gmelin, and now produced on a large scale in Germany, France, and the United States. The mixture is heated in closed crucibles in a furnace for several hours, and slowly cooled. A greenish porous cake is the product. This is the green *ultramarine* of commerce. The material is again powdered and again subjected to calcination, when upon cooling there results the proper blue color. It has never been determined to what cause this color is due. Certain variations in the proportion of the ingredients produce violet-blue colors. Also *French, Guinelt, new, and permanent blue*.—**Green ultramarine**. See *artificial ultramarine*, above.—**Native ultramarine**. Same as *def. 1.*—**Yellow ultramarine**, barium chromate. See *barium*.

**II.** *a.* Situated or being beyond the sea. The loss of the *ultramarine* colonies lightened the expenses of France.

*Burke, State of the Nation.*

**Ultramarine ashes**, the residuum of lapis lazuli after the ultramarine has been extracted, used as a pigment by some old masters as a middle or neutral tint for flesh, skies, and draperies: it is a purer and tenderer gray than that produced by mixture of more positive colors. *Fairholt.—Ultramarine blue.* See *I.—Ultramarine green.* See *green*.

It. ultramontano, < NL. \*ultramontanus, < L. ultra, beyond, + montanus, of or pertaining to a mountain, < mont(-)s, mountain. Cf. transmontane.*] **I.** *a.* Being or lying beyond the mountains; *tramontane*: opposed to *cismontane*. Specifically—(*a.*) Lying or belonging to the north of the Alps, in reference to Italy: the sense in which the epithet was originally used. *Tramontane* is now more generally employed. (*b.*) Lying to the south of the Alps—that is, beyond the mountains as regards the countries to the north of the Alps; Italian; specifically, of or belonging to the Italian party in the Church of Rome; holding the doctrines of ultramontaniam.—**Ultramontane party**, in *German politics*, the Center party, which opposes legislation supposed to be inimical to the Church of Rome.

**II.** *n.* One who resides beyond the mountains; a foreigner. Specifically—(*a.*) Formerly, one who resided north of the Alps; hence, one who maintains the rights of the northern churches, as the Gallican, in opposition to the claims of universal supremacy put forth for the popes; one who is unfavorable to papal claims of supremacy and infallibility.

He is an *ultramontane*, of which sort there hath been none [no pope] these fifty years. *Bacon, Obs. on a Libel.*

*Milman, Latin Christianity, xiii. 1.*

(*b.*) One who resides south of the Alps, or who identifies himself with the Italian party in the Roman Catholic Church, and maintains the doctrine of absolute papal supremacy. See *ultramontaniam*.

To the *Ultramontane*, holding that the temporal welfare no less than the eternal salvation of men depends on submission to the Church, it is incredible that Church-authority has but a transitory value.

**ultramontaniam** (ul'trā-mon'tā-niz-m), *n.* [= *F. ultramontanisme = Sp. Pg. ultramontanismo; as ultramontane + -ism.*] The doctrines of *ultramontanes*; the views of that party in the Church of Rome which places an absolute au-

thority in matters of faith and discipline in the hands of the Pope, in opposition to the views of that party which would place the national churches, such as the Gallican, in partial independence of the Roman curia, and make the Pope subordinate to the statutes of an ecumenical council. According to ultramontaniam, the Pope is superior to general councils, independent of their decrees, and is considered to be the source of all jurisdiction in the church. The Vatican Council of 1869–70 virtually established the views of ultramontaniam as dogmas of the Roman Catholic Church.

*Encyc. Brit., III. 46.*

**ultra-Protestantism** (ul'trā-prot'es-tān-tizm), *n.* Ultra-Protestant doctrines or methods.

A spirit of *ultra-Protestantism* mingled with and became an animating principle of the opposition which was raised against his [James II.'s] assaults upon the constitution.

*Sir E. Creasy, Eng. Const., p. 275.*

**ultra-red** (ul'trā-rēd), *a.* Beyond the red: used of the invisible heat-rays, less refrangible than those forming the lower or red part of the spectrum, more commonly called the *infra-red* rays. See *spectrum*.

**ultra-religious** (ul'trā-rē-lij'us), *a.* Religious in the extreme; excessively religious.

In the law of corporations an act is said to be *ultra vires*—(*a.*) when it is not within the scope of the powers of the corporation to perform it under any circumstances or for any purpose; or (*b.*) with reference to the rights of members, when the corporation is not authorized to perform it without their consent; or (*c.*) with reference to some specific purpose, when it is not authorized to perform it for that purpose.

**umbellifer** (um-bel'ē-fēr), *n.* [*< NL. umbellifer*; see *umbelliferous*.] In bot., a plant of the order *Umbellifera*.

**Umbelliferae** (um-bel'ē-rē), *n. pl.* [NL. (A. L. de Jussieu, 1789), fem. pl. (sc. L. *plantae*, plants) of *umbellifer*: see *umbelliferous*.] An order of plants, of the cohort *Umbellales*, known as the parsley family. It is distinguished by a two-celled ovary forming in fruit a cremocarp consisting commonly of two dry one-celled and one-seeded mericarps or achenes, separating from each other at maturity, and hanging from the top of a slender axis or carpophore. It includes about 170 genera with about 1,400 species, classed in 9 tribes, of which *Hydrocotyle*, *Mulinum*, *Sauvignia*, *Echinophora*, *Ammi*, *Seseli*, *Poaedacium*, *Cucubus*, and *Laserpitium* are the types. They are natives chiefly of north temperate regions, especially numerous in Europe and Asia, reaching the arctic zone and mountains within the tropics, also numerous in the temperate parts of South America, South Africa, Australia, and New Zealand. Most of the species are herbs with dissected alternate leaves of many ternate or pinnate leaflets, the petiole commonly dilated into a sheathing base. The flowers are small, usually white or yellow, and borne in simple or compound umbels, generally furnished with a row of narrow bracts forming an involucre or involucre. Each flower consists commonly of five small imbricated petals, as many stamens inflexed in the bud, and an ovary crowned with an epigynous two-lobed disk which rises into two conical stylopodia, each tipped with a distinct filiform style. The fruit is commonly traversed by canals (oil-tubes or *vitae*) filled with a liquid or gummy oil of a highly penetrating and characteristic odor. The genera resemble one another closely, and are distinguished mainly by the ridges, the oil-tubes, and the commissure or inner face of the fruit; each carpel bears five primary ridges (*juga*), and frequently also five intermediate secondary ones, the channels (*valliculae*) between them often containing oil-tubes. Many are protogynous, or mature their pistils earlier than the stamens, thus securing cross-fertilization. The order is one of strongly marked properties; many umbelliferous plants contain a poisonous, acrid, watery liquid, especially the hemlock (see also *Conium*, *Cicuta*, *Eranthis*, and *Ethusa*). Many species yield stimulating gum-resins, as *asafoetida*, *asafetida*, *galbanum*, *opopanax*, and *gum ammoniacum* (see also *Ferula*, *Thapsia*, and *Laserpitium*). Others contain a carminative aromatic oil, and furnish condiments, as anise, dill, caraway, coriander, and cumin. From another group these principles are nearly absent, and the stem or leaf becomes edible, as parsley, celery, and samphire, or the root, as the carrot, parsnip, and skirret. Others are of great medicinal reputation, as fennel and species of *Eryngium* and *Archangelica*. The order is remarkable for its little resemblance or close relationship to any other except the *Araliaceae*, which are, however, readily distinguished by their usually fleshy fruit, often of more than two carpels. Perhaps no other order is so free from variation or from exceptional forms, although in a few genera the characteristic habit is greatly disguised—as in *Eryngium*, where the umbels are replaced by compact heads; *Hydrocotyle*, with roundish undivided leaves; and *Nasturtium*, with broad and showy white involucre.

**umbelliferous** (um-bel'ē-fēr), *a.* [*< NL. umbellifer*; see *umbellifer*.] In bot., a plant of the order *Umbellifera*.

**Umbellularia** (um-bel'ē-lā'ri-ā), *n.* [NL. (Nees, 1836), from the umbellate flowers: < *umbellula*, a little umbel: see *umbellule*.] 1. A genus of apetalous trees, of the order *Laurineae* and tribe *Lauraceae*. It is distinguished from *Litsea* (the type) by extrorse anthers in the fourth row, and forms, in its stamens, a connecting-link to the other chief tribe, *Persea*. The principal species, *U. Californica*, the spice-tree (which see), mountain-laurel, or Californian bay-tree, is a tall smooth Californian tree, reduced southward and in the mountains to a small shrub. It bears alternate velvety and odorless evergreen leaves, and numerous short-celled yellowish-green flowers, each umbel at first in-

cluded in a caducous globose involucre, and followed by one or two roundish dark-purple drupes. A second species occurs in Mexico.

2. In zool., a genus of deep-sea alcyonarian polyps, having the polypites clustered in an umbel on top of the polypidom, and a long slender stalk somewhat bulbous at the base, as in *U. euerinus* or *U. grandicauda*. Lamarck, 1801.

**umbellulate** (um-bel'ē-lāt), *a.* [*< NL. \*umbellulatus*, < *\*umbellula*, an umbellule: see *umbellule*.] In bot., provided with or arranged in umbellules or umbellets.

**umbellule** (um-bel'ūl), *n.* [*< NL. \*umbellula*, dim. of *umbella*, *umbel*: see *umbel*.] A partial umbel; an umbellet. See *umbel*.

A natural pigment somewhat resembling an ochre, but darker and browner, due to the presence of oxide of manganese. It probably originally came from Umbria in Italy, but now the best varieties come from Cyprus. The natural earth is called *raw umber*. When it is heated to almost a red heat in a furnace, the brown hydrated oxide of iron is changed into the red oxide of iron, and the pigment becomes redder and deeper in color, and is called *burnt umber*. Both these umberes are very important colors, both for artists and in house-painting. They are permanent, pure in tone, and of great service in making various tints.

I'll put myself in poor and mean attire,  
And with a kind of umber smirch my face.

Shak., As you like it, i. 3. 114.

*II. n.* 1. [*cap.*] One who maintains the unipersonality of the Deity; one who denies the doctrine of the Trinity; specifically, a member of a Christian body founded upon the doctrine of unipersonality. The churches of the Unitarian body are congregational in government, and independent of one another. They possess no common symbol of doctrine, and differ widely among themselves. They may be divided into two schools of thought, though there is no sharply defined line between them. The conservative Unitarians hold doctrinal views in many respects resembling those of the orthodox Trinitarians, except in their denial of the tripersonality of the Deity. They accept Christ as the manifestation of God in a human life, though they do not regard him as equal in character or power with the Father. They believe in the work of the Holy Spirit, though they do not generally regard him as a distinct personality. They believe in the Scriptures as containing a divine revelation, and in the miracles as an attestation of that revelation. They hold a doctrine of inherited depravity, but not in guilt, except as the result of a personal choice; to a doctrine of future retribution, though not generally to its endlessness; to an atonement by Christ for the sins of mankind, but not to the expiatory theory of that atonement (see *atonement*); and to the necessity of regeneration wrought by the Spirit of God, but only with the co-operation of man; in what is called "irresistible grace" they do not believe. The doctrines of election, reprobation, foreordination, and decrees, as those doctrines are interpreted in the Calvinistic symbols, they repudiate as unscriptural and irrational. The radical school of Unitarians hold views not materially varying from deism. They reverence Christ as a peculiarly holy man, with whom the Spirit of God abode, but in no sense other than that in which he abides with every truly holy man. They respect the Bible as a work of transcendent moral genius, but in no other sense inspired. They do not believe in the miracles, and either explain them as the product of natural causes or regard the accounts of them as mythical and traditional. They do not accept the doctrines of atonement and regeneration, and do not employ the terms; and they both attribute sin to defective education, intellectual and moral, and depend upon a right education to redeem the world from its effects. The Unitarian movement in the United States was developed chiefly in New England about the beginning of the nineteenth century, under the lead of Dr. Channing. Many of the oldest Congregational churches in New England passed under Unitarian control, and the "American Unitarian Association" was formed in 1825. Outside of the denomination proper, Unitarian views are held by the Hicksite Friends, some Universalists, and by individuals in other denominations. See *Arian*, *Socinianism*.

2. A monotheist; a believer in one God, as opposed to a polytheist, or a believer in many gods. In this sense it is applicable to all Christians, Jews, and Mohammedans, as well as deists. *Fleming*. [Rare.]

3. A monist. The Realists or Substantialists are again divided into Dualists, and into Unitarians or Monists, according as they are or are not contented with the testimony of consciousness to the ultimate duplicity of subject and object in perception. *Sir W. Hamilton, Metaphysics*, xvi.

4. One who advocates any unitary system; an advocate of unity; in politics, an advocate of centralization.

The old men studied magic in the flowers,  
And human fortunes in astronomy,  
And an omnipotence in chemistry,  
Preferring things to names, for these were men,  
Were unitarians of the united world,  
And, whosoever their clear eye-beams fell,  
They caught the footsteps of the Same. *Emerson, Blight*.

**Unitarianism** (ū-ni-tā'ri-an-izm), *n.* [*< Unitarian + -ism*.] 1. The affirmation of the unipersonality of the Deity; the denial of the doctrine of the Trinity, or (rarely) of polytheism; the doctrines of the Unitarians.—2. [*I. c.*] Any unitary system.

The principle, in short, which gives its form to our government is (to use a foreign but convenient expression) *unitarianism*, or the habitual exercise of supreme legislative authority by one central power.

*A. V. Dicey, Law of the Constitution*, p. 127.

3. [*I. c.*] In *philos.*, the doctrine that mind and matter are one, or that there is but one general kind of substance.

**Unitarianize** (ū-ni-tā'ri-an-iz), *v.*; pret. and pp. *Unitarianized*, ppr. *Unitarianizing*. [*< Unitarian + -ize*.] To cause to conform, or to conform to Unitarianism. *Imp. Dict.*

**unitary** (ū-ni-tā-ri), *a.* [= *F. unitaire* = *Sp. It. unitario*, unitarian (chiefly as a noun, a Unitarian); as *unit, unit-y, + -ary*.] 1. Of or relating to a unit; of the nature of a unit; not divided; entire: specifically noting in chemistry that system in which the molecules of all bodies are compared, as to their magnitude, with one molecule—water, for example—and all chemical reactions are as far as possible reduced to one typical form of reaction, namely double decomposition. *Watts, Dict. of Chem.*—2. Of or pertaining to, or characterized by, unity or uniformity; also, directed at or striving for unity:

as, a *unitary* system of thought; in politics, centralized.

Man loves the Universal, the Unchangeable, the *Unitary*. *Channing, Perfect Life*, p. 110.

Had any one doubted before that the rights of human nature are *unitary*, . . . the efforts of the advocates of slavery . . . could not fail to sharpen his eyes. *Lowell, Study Windows*, p. 173.

We know that the separation and isolation of the different parts of a once *unitary* community must necessarily bring about a separation of its language into different dialects. *W. D. Whitney, Life and Growth of Lang.*, ix.

It of course by no means follows that, because we have become in the fullest organic sense a nation, ours has become a *unitary* government, its federal features merged in a new national organization. *W. Wilson, State*, § 881.

3. In *biol.*, monistic, as distinguished from dualistic.

The tendency called *unitary* or monistic . . . must ultimately prevail throughout philosophy.

*Haeckel, Evolution of Man* (trans.), I. 17.

4. Pertaining to or of the nature of a unit (of measurement).

A wind pressure of 1,200 pounds for the same *unitary* distance is allowed for. *Sci. Amer.*, N. S., LX. 304.

5. In *math.*, involving a root to unit power.

**Unitas Fratrum** (ū-ni-tas frā'trum). [NL., unity of brethren: *L. unitas*, unity; *fratrum*, gen. pl. of *frater*, brother: see *brother*.] The proper official name of the Moravian Church. See *Moravian*, *n.*, 2.

**unitate** (ū-ni-tāt), *v. t.*; pret. and pp. *unitated*, ppr. *unitating*. [A back-formation from *unitation*.] To perform the operation of unitation upon.

**unitate** (ū-ni-tāt), *n.* [As *unit + -ate*.] The remainder given by a number after division by a digit.

**unitation** (ū-ni-tā'shon), *n.* [*< unit + -ation*.] 1. Expression in terms of units; measurement in accordance with a system of units.—2. The operation of adding to the units of a number, written in the Arabic notation, (10—N) times the tens (where N is any number less than 10), (10—N)<sup>2</sup> times the hundreds, etc., and repeating the process until a digit is obtained. This (diminished by any multiple of N which it exceeds) is the remainder after dividing the original number by N.

**unite**<sup>1</sup> (ū-nit'), *v. t.*; pret. and pp. *united*, ppr. *uniting*. [*< LL. unītas*, pp. of *unire* (> *It. unire* = *Sp. Pg. unir* = *F. unir*), make one or as one, join together, < *L. unus*, one: see *one*, *a*. Cf. *one*, *v.*, and *adunation*.] *I. trans.* 1. To combine or conjoin so as to form one; make to be one and to be no longer separate; incorporate in one: as, to *unite* two kingdoms or two armies.

*Unite*  
Your troops of horsemen with his bands of foot.  
*Shak.*, I Hen. VI., iv. 1. 164.

As thou hast *united* our nature to thy eternal being, thou mightest also *unite* my person to thine by the interior adunations of love, and obedience, and conformity.

*Jer. Taylor, Works* (ed. 1835), I. 37.

2. To connect, conjoin, bring together, or associate by some bond, legal or other; join in interest, affection, fellowship, or the like; ally; link together; associate; conjoin; couple; combine: as, to *unite* families by marriage; to *unite* nations by treaty; to *unite* fresh adherents to a cause.

Hymen did our hands  
*Unite* commutual in most sacred bands.  
*Shak.*, Hamlet, iii. 2. 170.

3. To make to agree or be uniform; harmonize.

The king proposed nothing more than to *unite* his kingdom in one form of worship. *Clarendon, Great Rebellion*.

4. To cause to adhere; attach; connect together: as, to *unite* bricks or stones by means of cement.

The peritonæum, which is a dry body, may be *united* with the muscularous flesh. *Wieman, Surgery*.

=*Syn.* 1. To consolidate, amalgamate, blend, merge.

*II. intrans.* 1. To become one; become combined or incorporated; be consolidated; coalesce; combine; commingle.

Virgin Mother, hail,  
High in the love of Heaven; yet from my loins  
Thou shalt proceed, and from thy womb the Son  
Of God Most High; so God with man *unites*.  
*Milton*, P. L., xii. 382.

2. To join in action; concur; act in concert.

If you will now *unite* in your complaints,  
And force them with a constancy, the cardinal  
Cannot stand under them.

*Shak.*, Hen. VIII., iii. 2. 1.

**unite**<sup>2</sup> (ū-nit'), *a.* [*< LL. unītas*, pp. of *unire*, unite: see *unite*<sup>1</sup>, *v.*] United; joint. *Webster*.

**unite**<sup>3</sup> (ū-nit'), *n.* [*< unīti*<sup>1</sup>, *v.*, with ref. to the union of the kingdoms of England and Scot-

unity (ū-ni-ti), *n.*; pl. *unities* (-tiz). [Formerly *unitas* (Latin), *unity* (English). See *unity*.] *Sp. unididad* = [e.g. *unidad* = unity, *unidades* = oneness, singleness, sameness, uniformity, agreement, < *unus*, one: *unus* = 1. The state or property of being one; oneness, as opposed to multiplicity; individuality, as opposed to plurality.]

Now *unity*, which is defined, is in its own nature more apt to be understood than multiplicity, which in some measure participates of infinity. *Dryden*, *Life of Plutarch*.  
 It is the unity of any idea that it be considered as one representation or picture, though made up of many different parts.  
*Locke*, *Human Understanding*, II. xxiv. 1.

2. Organic totality: that interconnection of parts which constitutes a complex whole; a systematic whole as distinguished from its constituent parts: as, the *unity* of consciousness; the *unity* of an artistic creation. See def. 9.

The simplest human consciousness contains more than sensation. It contains a reference of sensation to objects; the simplest human consciousness also contains some conception of the *unity* of all objects in one world (were it not that it represents them all as existing in one space and one time).  
*Caird*, *Philos.* of Kant, p. 263.

An empirical acquaintance with facts rises to a scientific knowledge of facts, as soon as the mind discovers beneath the multiplicity of single production the *unity* of an organic system.  
*Max Muller*.

3. Identity; self-sameness; uniformity.  
 If the *unity* of the Ego is really illusory, if the permanent identical "I" is not a fact but a fiction, as Hume and his followers maintain, why should one part of the series of feelings into which the Ego is resolved be concerned with another part of the same series, any more than with any other series?  
*H. Sidgwick*, *Methods of Ethics*, p. 389.

We are able to say that the *Unity* or Continuity of nature is a principle or law of experience.  
*W. R. Sorley*, *Ethics of Naturalism*, p. 267.

4. The state of being united or combined in one; especially, union as connected parts of a complex whole: as, the national *unity* of the separate states.  
 England had hardly as yet [829] realized the need of national *unity*, and outside the king's council chamber there can have been few who understood the need of union between the nations of Christendom.  
*J. R. Green*, *Conq. of Eng.*, ii.

5. Harmony or accord in sentiments, affection, action, etc.; concord.  
 How good and how pleasant it is for brethren to dwell together in *unity*!  
 Ps. cxxxiii. 1.

*Unity*, secrecy, decision, are the qualities which military arrangements require.  
*Macaulay*, *Hallam's Const. Hist.*

6. Sameness of character or effect; agreement; coincidence.  
 There is such *unity* in the proofs. *Shak.*, *W. T.*, v. 2. 35.

7. In *math.*, a quantity which, multiplied by any quantity of the system considered, gives that same quantity as the product. Thus, in the theory of matrices, the matrix of any order having all the constituents zero except those of the principal diagonal, which are all ones, is the *unity* of that order. In ordinary algebra one, or the unit of abstract number, is the only *unity*. *Unit* and *unity* are words frequently confused; but with accurate writers unit is the standard of measurement, that which is counted, and has no reference to multiplication; while *unity* has reference to multiplication alone. In a multiple associative algebra there are as many units as the ordinal number of the algebra, but there can be but one *unity*, and there need not be any at all.

8. The principle by which a uniform tenor of story and propriety of representation is preserved in literary compositions; conformity in a composition to this principle: a reference to some one purpose or leading idea, or to the main proposition, in all the parts of a discourse or composition. The so-called Aristotelian law of *unity* of time, place, and of action (called 'the unities') in a drama was the fundamental rule or general idea from which the French classical dramatic writers and critics derived, or to which they referred, all their practical rules for the construction of a drama. This law demanded that there should be no shifting of the scene from place to place, that the whole series of events should be such as might occur within the space of a single day, and that nothing should be admitted irrelevant to the development of the single plot.

The author has not observed a single *unity* in his whole play.  
*Addison*, *Sir Timothy Tittle*.

The writers of plays have what they call *unity* of time and place, to give a justness to their representation.  
*Steele*, *Spectator*, No. 358.

The so-called *unities* of time and place are purely fictitious principles, to either of which it may be convenient to adhere in order to make the *unity* of an action more distinctly perceptible, and either of which may

with equal propriety be disregarded in order to give the action probability.

*A. W. Ward*, *Intro. to Eng. Dram. Lit.*, p. xi.

9. In artistic creations, a combination of parts such as to constitute a whole or to exhibit a form of symmetry in style and character; the quality of any work by which all the parts are subordinate to or promotive of one general design or effect.  
 Among the susceptibilities touched by artistic arrangements may be noticed the sense of *Unity* in multitude, arising when a great number of things are brought under a comprehensive design, as when a row of pillars is crowned by a pediment.  
*A. Bain*, *Emotions and Will*, p. 235, note.

10. In law: (a) The holding of the same estate in undivided shares by two or more; joint tenancy. (b) The joint possession by one person of two rights by several titles.—11. A gold coin of the reign of James I. See *united*. — Architectonic *unity*. See *architectonic*. — At *unity*, at one; in accord or harmony.

A character at *unity* with itself . . . is strong by its very negations.  
*George Eliot*, *Mill on the Floss*, v. 2.

Formal *unity*. See *formal*. — Manchester *Unity*. See *Old Fellow*. — Material, mathematical, numerical *unity*. See the adjectives. — Primitive *unity* root of *unity*. See *primitive*. — *Unity* of apperception. See *apperception*. — *Unity* of estate, of possession, of time, of title. See *estate in joint tenancy*, under *estate*. — *Unity* of type, in *ind.*. See *type*. = *Syn.* 1-4. *Junctum*, *Connection*, etc. See *union*.

univalency (ū-niv'a-len-si), *n.* [As *univalence* (see *-cy*).] Same as *univalence*. Also called *monovalency*.

univalent (ū-niv'a-lent), *a.* [*< L. unus*, one, + *valen(t)-s*, ppr. of *valere*, be strong, have power: see *valid*.] Having a valence of one; capable of replacing a single hydrogen atom in combination.

univalve (ū-ni-valv), *a.* and *n.* [*< L. unus*, one, + *valva*, valve: see *valve*.] I. *a.* 1. Having one valve only, as a mollusk; not bivalve or multivalve; univalved or univalvular. See II. — 2. Having the carapace single, or not hinged in the middle line; specifying the cladoceros or daphniaceans. [Now rare.] — 3. In bot., consisting of one valve or piece.

II. *n.* In conch., a univalve mollusk or its shell; a shell consisting of a single piece; formerly, a member of one of three Linnean divisions of *Testacea*, as distinguished from *bivalves* and *multivalves*. The great group of gastropods are univalves. The single valve is sometimes very small, slight, rudimentary, or hidden beneath the mantle; but in most cases it is large and stout, nearly or completely inclosing the soft parts; and in such cases it usually acquires a twist or spiral coil, either in one plane, or, oftener, rising in a conical spire endlessly varied in de-

tails of size, shape, etc. Such coiled univalve shells are familiar objects, as those of the snail, whelk, periwinkle, etc. Sometimes the coils are quite flat, as in the planorbis; or the spire is so slight, and the first whorl so large, that the resulting figure is ear-like or saucer-shaped, as in the nerit. Some univalves are simple caps or cones, as the limpets. Some are tubular, as the tooth-shells; or tubular and variously contorted, as the worm-shells or vermetids. Some have an egg-shaped or fusiform figure. Many univalves have actually a second shell or valve, the operculum or lid of the aperture; this, however, does not count against their being univalvular. Many forms of ordinary univalves have special names, as *helicoid*, *convol*, *discoïd*, *ovoid*, *trochoid*, *turbinat*, *turreted*. The direction of the coiling, whether right or left, is *dextrorse* or *sinistrorse*; a coiling in the opposite from the usual direction is *reversed*. The first whorl of a spiral univalve is the *body-whorl*; its opening is the *aperture*; the lips of the aperture are the *outer* or *labrum*, and the *inner* or *columella*, the *labium*; the lips may be variously produced, winged or *alate*, *canaliculate*, etc. (See *holostomatous*, *siphonostomatous*.) The central pillar around which the whorls are coiled is the *columella*; the whorls above the

Sole monarch of the universal earth.

Shak., R. and J., iii. 2. 94.

All partial evil, universal good.

Pope, Essay on Man, i. 292.

**2.** Pertaining to all things or to all mankind distributively. This is the original and most proper signification.

Those men which have no written law of God to show what is good or evil carry written in their hearts the *universal* law of mankind, the Law of Reason, whereby they judge, as by a rule which God hath given unto all men for that purpose. Hooker, Eccles. Polity, i. 16.

Nothing can be to us Catholic or universal in Religion but what the Scripture teaches.

Milton, Eikonoklastes, xiii.

Which had the *universal* sanction of their own and all former ages.

Story, Speech, Salem, Sept. 18, 1828.

**3.** Belonging to or predicated of all the members of a class considered without exception: as, a *universal* rule. This meaning arose in logic, where it is called the complex sense of *universal*, and has been common in Latin since the second century.

Hearing applause and universal shout.

Shak., M. of V., iii. 2. 144.

We say that every argument which tells in favour of the *universal* suffrage of the males tells equally in favour of female suffrage. Macaulay, West. Rev. Def. of Mill.

**4.** In logic, capable of being predicated of many individuals or single cases; general. This, called the simple sense of *universal*, in which the word is precisely equivalent to *general*, is quite opposed to its etymology, and perpetuates a confusion of thought due to Aristotle, whose *καθολικόν* it translates. (See II. 1 (b).) In Latin it is nearly as old, perhaps older, than def. 3.—**Universal agent**, in law, an agent with unqualified power to act, in place of his principal, in all things which the latter can delegate, as distinguished from a *general agent*, who has unrestricted power in respect to a particular kind of business or at a particular place.—**Universal arithmetic**, algebra.—**Universal chuck**, a form of chuck having a face-plate with dogs which can move radially and simultaneously, to hold objects of different sizes.—**Universal church**, in *theol.*, the church of God throughout the world.—**Universal cognition**. See *cognition*.—**Universal compass**, a compass with extension legs adapted for striking circles of either large or small size.—**Universal conception**, a general concept.—**Universal conversion**. See *conversion*, 2.—**Universal coupling**, a coupling so made that the parts united may meet at various angles, as a gimbal joint.—**Universal deluge**. See *deluge*, 1.—**Universal dial**. See *dial*.—**Universal ferment**. See *ferment*.—**Universal Friends**, an American sect of the eighteenth century, followers of Jemima Wilkinson, who professed to have prophetic and miraculous powers.—**Universal galvanometer**, a galvanometer capable of measuring either currents or electromotive forces or resistances. It usually consists of an ordinary galvanometer, which may have any suitable form, combined with a set of resistance-coils and a slide-bridge all mounted on one base.—**Universal gravitation**. See *gravitation*.—**Universal instrument**, in *astron.*, a species of altitude and azimuth instrument constructed so as to combine portability with great power. The telescope of the instrument, instead of being a straight tube, is usually broken into two arms at right angles to each other in the middle of its length, and at the break a totally reflecting prism turns the rays entering the object-glass along the eye-end of the telescope which forms part of the horizontal axis of the circle, so that the telescope becomes free to move through all altitudes.—**Universal joint**. See *joint*.—**Universal legatee**, in *Scots law*, a legatee to whom a testator gives his whole estate, subject only to the burden of other legacies and debts.—**Universal lever**, logic, method, partnership. See the nouns.—**Universal mood**, a mood of syllogism concluding a universal proposition.—**Universal part**, a part of a universal whole. Sir W. Hamilton.—**Universal Postal Union**. See *postal*.—**Universal proposition**. See *proposition*.—**Universal successor**, in *Scots law*, an heir who succeeds to the whole of the heritage of a person who dies intestate.—**Universal suffrage**. See *suffrage*.—**Universal switch**, an apparatus used in telegraph- and telephone-offices for facilitating the connecting of one line to another. It usually consists of a large board or slab of insulating material, on the face of which are mounted two sets of parallel conducting-rods placed across one another. Each rod forms the terminal of one line, and hence any two lines can be connected together by a plug where their terminal rods cross each other.—**Universal syllogism**, theorem, time, etc. See the nouns.—**Universal umbel**. See *umbel*.—**Universal unity**, the capability of existing in many subjects while retaining its identity. This is the unity of a general character belonging to many objects.—**Universal validity**, cogency

for all men. This is a phrase used by certain writers who misapprehend the doctrine of Kant.—**Universal whole**, a class with respect to the subjects included under it. = Syn. 3. General, etc. See *common*.

**II. n. 1.** In logic: (a) One of the five predicables of the Aristotelians, or logical varieties of predicates, which are said to be genus, species, difference, property, and accident. (b) A general term or predicate, or the general nature which such a term signifies. In order to understand the great dispute concerning universals it is necessary to remark that the word in this sense entirely departs from its etymology. The universe is incapable of general description, and consists of objects connected by dynamical relations and recognized by associations of contiguity; while a universal is an idea connected with experience by associations of resemblance merely. But though a universal is, in its universality, thus not contracted to actual existence, it does not necessarily follow that things real have in their real existence no universal predicates. The common belief is that the mutual actions of things are subjected to laws that are really general—that the laws of mechanics, for instance, are not mere accidental uniformities, but have a real virtue. These laws may be subject to exceptions and interference; such has always been the vulgar belief, and in most ages that of philosophers; it may be they are never precisely followed. But any tendency in the things themselves toward generalizations of their characters constitutes what is termed a *universal in re*. Before the laws of physics were established it was particularly the uniformities of heredity, and consequent commonness of organic forms, which specially attracted attention; so that *man* and *horse* are the traditional examples of universals *in re*. The dispute concerning universals chiefly concerns the universals *in re*, and arises from the different degrees of importance attributed by different minds to the dynamical and to the intelligible relations of things. Those who follow the common opinion are called *realists*. The other party, looking at the blind dynamical character of the connections of things, denies that there is any real operation of law or intelligible guidance. These are the *nominalists*, who may take one of three main positions. First, there are those who hold that the uniformities of nature are due to the interference on every single occasion of general creative ideas, called *universals ante rem*. Second, there are those who, admitting that intelligible relations do govern one great department of creation—namely, the world of thought, so that there are general conceptions, called *universals post rem*—insist that the notion of a law of nature, properly speaking, is purely illusory. Things as they are are therefore entirely incomprehensible, and all that is intelligible is mere seeming. Yet this seeming has so consistent a character that it is for all intents and purposes the real world; and this seemingly real world is seemingly governed by law, which, indeed, is the only feature in it which makes it seem like real. This is substantially Kantianism. Third, there are those who deny universals *in re*, *ante rem*, and *post rem*, holding that association by resemblance is reducible to association by contiguity, that generalization takes place only upon paper or in talk, and that every fact is at bottom unintelligible. In the middle ages, if not at all times, the realistic opinion has often been carried too far, the mere resemblances of things, which are nothing but the native tendency of the mind to associate them, being supposed to indicate more intimate dynamical relations than can justly be inferred on such a ground alone.

It is only in their dynamical connections that the objects of the universe can be distinguished from all others; and therefore no general term in a proposition can show what universe is meant; but an index is necessary. See *index*, n. 2.

Everything in the *universe* (whatever that *universe* may embrace) is either A or not A.

De Morgan, Formal Logic (1847), ii.

We must be supposed to know the nature and limits of the *universe* of discourse with which we are concerned, whether we state it or not. If we are talking of ordinary phenomena we must know whether we refer to them without limit of time and space; and if not, within what limits, broadly speaking. If we include the realms of fiction and imagination we must know what boundaries we mean to put upon them. Venn, Symbolic Logic, vi.
